

HEALTHSPAN

HEALTHSPAN HQ

Supply Chain / Warehouse User Manual

For the warehouse team

hq.healthspan.ph · August 2026 · the app updates weekly — this manual describes what is live today

1 • Getting started

Sign in

1. Open hq.healthspan.ph in any browser (Safari, Chrome — phone, iPad, or computer).
2. Enter your Healthspan email and password. Tick Remember me on your own device; leave it unticked on shared computers.
3. Forgot your password? Ask an admin — they can set a new one in seconds. You can change it anytime via the password link at the bottom of the sidebar.

Install it as an app (do this once)

1. On iPhone/iPad: open hq.healthspan.ph in Safari → tap Share → Add to Home Screen.
2. On Android: open it in Chrome → menu : → Add to Home screen.
3. It now opens full-screen like a real app, with the Healthspan icon.
4. Make the bottom bar yours: Menu → ☆ Customize bar — pick the pages you use most for one-tap access. Home and Menu are always there (specialists also keep Log visit and New order fixed, with 2 free slots; everyone else picks 4).

The bell

The bell at the top pings you when the system needs you — a red badge shows unread items. Tap it to see what happened and jump straight to the right page. It checks for news every 90 seconds. What pings whom is listed at the end of this manual.

Ask AI

The Ask AI button answers plain-language questions over everything HQ knows — inventory, sales, receivables, cheques, approvals, backorders, quotes, pipeline — and its knowledge is automatically scoped to YOUR role: specialists get their own numbers, costs and margins only answer for finance and admin. Any hour, in the app or on Slack (/stock).

Your manual & view-only pages

The manual link at the bottom of the sidebar (phone: Menu → My manual) opens this manual INSIDE the app — read it there, download it, or pop it full screen. And wherever a page is read-only for your role, a banner at the top says so and names who actually edits it; the same pages carry a small “VIEW” badge on your home screen.

Best on the warehouse iPad — installed as an app, the camera is one tap away.

TIP — Every number view has a plain-language description at the top and a “how is this calculated” section — read those before asking. Most views also export to CSV.

Home, navigation & everyday mechanics

Home is the command center: live stat chips (orders today, pending, open follow-ups...), a needs-attention line, and big launcher cards for your role. It updates in place while the data syncs — no flicker, no reload.

1. Sidebar search: type in the box at the top of the sidebar to filter every menu item; sections collapse and remember their state (Product lines starts collapsed).
2. Every page has a real URL: bookmark an account, an order, a pick list; the browser back button works; share links with teammates — they’ll see it with THEIR permissions.
3. Mobile: the bottom bar carries your essentials; the Menu button reaches every view, plus password change, sign-out, and theme.

4. Themes: Healthspan (brand blue, light/dark/system) or Classic — bottom of the sidebar.
5. Data freshness: the sheet syncs every 15 minutes; Shopify nightly at 2am; the footer shows the last sync. “Refresh” forces one.

Fulfillment — queue to doorstep

1. Fulfillment queue: every APPROVED pending order, oldest first, age-flagged. Held orders never appear — queue = cleared to ship.
2. Pick list (from the order): exact batch and bin per line, earliest expiry first (FEFO). Printable; doubles as packing slip.
3. Scan to pick: camera scan every unit against the order — wrong item red-stops, over-scan warns, progress bar per line, per-line “fill” fallback. All green → one tap writes the ledger AND fulfills the order; the specialist is pinged.
4. Confirm picked on the pick list does the same from the paper flow (offers to mark fulfilled in the same motion).
5. Delivery receipt: branded, VAT 12% split (net = ÷1.12), clinic delivery notes, signature blocks — and a permanent BIR-friendly DR number from the company series, assigned automatically the first time the DR is printed (the order keeps it forever). Record courier + waybill; mark dispatched / delivered.
6. Fulfilling or cancelling an order releases its ATP promise automatically.

Backorders — shortfalls with a life of their own

1. When a manager overrides the available-to-promise limit at order entry, the shortfall is recorded as a backorder automatically (order, SKU, units short).
2. Open backorders show at the top of the Fulfillment queue with their age.
3. Auto-release: the moment a PO receive covers the shortfall, the backorder releases itself — the warehouse and the order’s specialist are both pinged that the order can now ship.
4. Cancel a backorder manually if the underlying order was cancelled.

Transfer orders — branch shipments as documents

1. New transfer: pick the branch, add the lines.
2. Dispatch: every line leaves the ledger as a FEFO batch-stamped movement (ref TR-n) — the same trail the recall trace reads. The batches used are stamped on the document.
3. Delivered closes it. In-transit units show on the view instead of living in chat threads.
4. Per-branch on-hand still isn’t tracked (by design) — the document records what left, when, and in which batches.

Scan & the platform stock ledger

Logistics → Scan — camera or typed barcode, three modes:

1. Receive: books stock in with batch + expiry (also available against a PO — preferred).
2. Pick: books stock out, FEFO batch-stamped.
3. Count: records a physical observation vs the current truth (“counted 47 vs 45 — variance +2 logged”).

Everything lands in the append-only ledger (Recent movements panel shows the tail). In shadow mode the sheet remains the truth and the ledger builds evidence; after cutover the ledger IS the

stock, and every view (dashboard, alerts, forecasts, ATP) reads it. Counts are observations — they never move stock by themselves; closing a cycle count writes the actual adjustments.

Cycle counts — the evidence machine

Two consecutive 100% counts are the agreed evidence for retiring the sheet. Logistics → Cycle counts:

1. Start a count: “Count everything” or a single product line.
2. It’s a BLIND count: expected quantities stay hidden so nobody anchors. Type what you physically see; blank = skipped.
3. Close & grade: the session reports matched % and unit variance; every variance writes a ledger adjustment (ref CC-n) on the record.
4. Sessions list with match badges; the last two show on the Cutover page — both 100% lights “two clean counts ✓”.

CADENCE — Count a different line each week rather than everything monthly — steadier evidence, smaller sessions, faster path to two clean counts.

Purchase orders & receiving

1. Logistics → Purchase orders: draft → ordered → partially received → received. Incoming units and next-ETA show as cards.
2. Receiving at the door: per line — quantity, batch, expiry → straight into the stock ledger with unit costs recorded.
3. The AP block on each PO (terms, proforma ref, currency, FX total, amount paid, peso value) is finance’s to fill — leave it to them.

Quarantine & disposal — the compliance trail

Logistics → Quarantine & disposal. Stock that can’t be sold sits here — out of sellable stock and out of ATP — until someone decides.

1. Pull stock into quarantine: expiring, damaged, or QA-hold units — removed from the ledger immediately, with batch and reason on record.
2. Doubtful returned units land here too (chosen during returns receiving) — they never enter sellable stock unless released.
3. Release (after inspection): units go back into the ledger, with a note.
4. Dispose: closes the record with method/witness note, who, and when — the write-off trail for expired or damaged pharma product.
5. Cards show units held, their value at list price, and 90-day disposals.

Complaints log — quality reports with teeth

1. Anyone in the field files in seconds: account, product, batch from the box, what happened. Supply chain and management are pinged immediately.
2. The batch chip links straight into the recall trace — every other clinic that received the same lot, one tap away.
3. Statuses: open → investigating → closed. Closing requires a resolution note — the log is the compliance record and keeps everything, forever.

Warehouse KPIs — the scoreboard

1. Order cycle time: order taken → marked fulfilled (stamped automatically by pick-confirm, scan-to-pick, and status controls) — median and average over 30 days, plus the share fulfilled within 48 hours.
2. Fill rate: orders that never hit a backorder — the honest measure of stock keeping its promises.
3. Open queue: pending count, oldest age, and units picked this week.
4. The recent-fulfillments table shows each order's cycle time color-coded (green $\leq 48h$, amber $\leq 72h$, red beyond).

Suppliers, imports & multi-currency

1. Supplier master (Logistics → Suppliers & imports): every supplier with currency, payment terms, lead time in days, and contacts. Lead times sharpen ordering judgment — the forecast assumes ~2 months when unset.
2. On the water: every ordered/partial PO with an ETA, sorted soonest-first, with its customs status pill.
3. Import tracking per PO: ETD, ETA, customs status (in transit / clearing / cleared / delivered), and broker — edited right on the purchase order.
4. Multi-currency: the PO carries its currency, invoice total, amount paid, and the FX rate at payment — which converts foreign costs into real ₱ for the valuation page.
5. QA hold at receiving: when booking a delivery in, choose SELLABLE (straight to the ledger) or QA HOLD (quarantined until inspection releases it — released units enter the ledger as receives).

Recall trace & product registrations

1. Batch recall trace (Logistics): type a SKU/batch → every clinic that received it with dates and quantities — OUT-sheet history plus ledger picks, so it survives the sheet's retirement. Printable contact list in seconds.
2. Product registrations (Inventory): CPR/FDA type, number, expiry per SKU. Expired shows red ("EXPIRED Nd ago"), within 6 months amber countdown — both float to the top. Read-only for your role — flag renewals to finance/admin.

The inventory command center

1. Dashboard: KPI cards, running-out-in-30-days, category split, out-of-stock commercial, expiring-in-3-months.
2. Action center: everything needing action today, prioritized — the daily to-do.
3. All SKUs: sortable master list; tap for the product drawer (batches, 13-month trend, deals, forecast).
4. Alerts: out of stock · low stock · negative stock · expiry tracker · reorder alerts — each with exact SKUs and quantities.
5. Planning: stockout forecast (trend + seasonal velocity) · stock coverage · reorder plan · reorder point · demand variability (CV classes) · ABC analysis · write-off forecast.
6. Batch view: every batch with expiry and bin, FEFO-ordered — the same data behind pick lists and recall.
7. Data health: feed freshness, price $\neq$ Shopify and stock $\neq$ Shopify reconciliation — the system tells you when to distrust its own feed.

Finance views: aged inventory · shrinkage tracker · cash in expiring stock — inventory as money.

Logistics views: Remedy branch shipments log · branch expiry watch.

Every view: plain-language description, “how is this calculated”, CSV export, full peso figures.

The ten simulators

Simulator	What it answers
What-if	Change price/velocity/lead time on one SKU — see stockout and cash effects
Promo rescue	Can a promo clear at-risk stock before it expires, and at what discount?
Budget optimizer	Best allocation of a fixed buying budget across SKUs
Service level	Safety stock needed for a chosen fill rate
Campaign surge	What a campaign’s uplift does to stock coverage
Monte Carlo stockout risk	Thousands of demand scenarios → probability of stockout per SKU
12-month projection	Stock trajectory a year out under current velocity
Cash-flow timeline	What the buying plan does to cash, month by month
Bulk-buy trade-off	Volume discount vs holding/expiry risk
Branch rebalancing	Which Remedy branch stock should move where

Each is one click, live data, with its method explained under the result.

Forecasting & the AI layer

1. Stockout forecast: trend + seasonal velocity per SKU; campaign windows banner it so promos stop being surprises.
2. Forecast accuracy (MAPE): each month’s forecast is frozen automatically, then scored against actual movement — MAPE and bias per month, worst misses ranked. The forecast grades itself.
3. AI planning review: one click walks every SKU, campaigns, and recent misses → an exception report with 5 prioritized actions and quantities.
4. Ask AI: plain-language questions over live inventory and sales, in-app or Slack (/stock), any hour.

The orders register & order pages

Every order ever — native HS orders plus the full migrated Shopify history (8,900+) — searchable, paginated (50/100/250 per page). You see everything.

1. Search & pages: the register is served page-by-page from the database — search by account, specialist, or order number (HS-1042 works); 50/100/250 per page.
2. Tap an order for its full page: lines, status, shipment panel (courier, waybill, dispatched/delivered), payment panel (paid, balance, terms), notes.
3. Statuses: pending → fulfilled, or cancelled. Held orders show an approval banner until decided.
4. Printables from the order page: FEFO pick list / packing slip, and the branded Delivery Receipt with VAT split, the clinic’s delivery notes, and signature blocks.

When the bell pings you

The bell pings only the person who ACTS — nobody is copied on someone else's action items. The queues themselves are always open in-app for anyone with access.

You get pinged when...	What to do	Where it takes you
A new order is approved and ready to pick	It's already on your queue, batches chosen	Fulfillment queue

The warehouse week

1. Daily: queue top-to-bottom, oldest first; scan every pick.
2. Receiving days: book against the PO with batch + expiry at the door.
3. Weekly: one cycle-count scope — build toward two clean counts.
4. Keep the sheet updated as normal until the Cutover page says otherwise.

Something looks wrong? Check Data health first (feed freshness and reconciliation), then tell the super admin. The app ships improvements weekly — if a step in this manual moved, it moved somewhere better.
