

HEALTHSPAN

HEALTHSPAN HQ

Supply Chain / Warehouse User Manual

For the warehouse team

hq.healthspan.ph · September 2026 · the app updates weekly — this manual describes what is live today

1 • Getting started

Sign in

1. Open hq.healthspan.ph in any browser (Safari, Chrome — phone, iPad, or computer).
2. Enter your Healthspan email and password. Tick Remember me on your own device; leave it unticked on shared computers.
3. Forgot your password? Ask an admin — they can set a new one in seconds. You can change it anytime from Settings (footer button; phone: Menu → Settings).

Install it as an app (do this once)

1. On iPhone/iPad: open hq.healthspan.ph in Safari → tap Share → Add to Home Screen.
2. On Android: open it in Chrome → menu : → Add to Home screen.
3. It now opens full-screen like a real app, with the Healthspan icon.
4. Make the bottom bar yours: Menu → ☆ Customize bar — pick the pages you use most for one-tap access. Home and Menu are always there (specialists also keep Log visit and New order fixed, with 2 free slots; everyone else picks 4).

Your favourites

1. Star any page from the ☆ in the top bar. It pins to the top of the sidebar, directly under Home, and to the top of your home page — one list, both places, so there is nothing to keep in sync.
2. Prefer to set them all at once? **Choose favourites** — the edit link on the home row, or Menu → Choose favourites on a phone — opens the full picker. Up to **10**.
3. The Favourites heading in the sidebar collapses and expands like every other section, and remembers which way you left it.
4. They are yours, on this device, the same as the bottom bar — and only pages your role can open are ever offered.

Sorting any table

Click any column heading to sort A-Z; click it again for Z-A. It works on every table in HQ. Money, quantities, dates and expiry months sort by their real value, not alphabetically, and blank cells always go to the bottom. Section headings and TOTAL lines stay put. The sort lasts until the page redraws — it is a way to look at what is on screen, not a saved setting.

When a page refreshes

After you do something — add a line, submit a form, approve, release — the page updates in place. It does not blank out or jump back to the top; whatever you were looking at stays put while the new numbers land. You only see a "Loading" message when you open a page for the first time.

Attaching files

Where you see + Attach, you can add files straight from your phone or computer — photos, quotations, receipts, signed slips. They are stored in the Healthspan Google Drive, and opening one goes back through HQ, so your access here decides what you can see. Anything over about 4 MB opens in Drive instead. Remove a file with the × beside it.

1. On an order: the order page, where the DR, the signed copy and the proof of delivery belong.
2. On a pull-out request: the register row underneath the form.
3. On any of the seven finance forms: the register row that appears once you submit — quotations, receipts, bank approvals, BIR forms.
4. On a complaint: the report row, which is where the batch photo belongs.

5. A file can only be removed by whoever uploaded it (or by whoever runs that area). Removing it deletes it from Drive too, so the × asks first.

The bell

The bell at the top pings you when the system needs you — a red badge shows unread items. Tap it to see what happened and jump straight to the right page. It checks for news every 90 seconds. What pings whom is listed at the end of this manual.

Ask Healthspan

The Ask Healthspan button (top bar) answers plain-language questions over everything HQ knows — inventory, sales, receivables, cheques, approvals, backorders, quotes, pipeline — and its knowledge is automatically scoped to YOUR role: specialists get their own numbers, costs and margins only answer for finance and admin. Any hour, in the app or on Slack (/stock). A small dropdown in the drawer header lets you choose which model answers — Gemini Flash (default) or Claude Haiku — and remembers your pick on this device.

Your manual & view-only pages

The manual link at the bottom of the sidebar (phone: Menu → My manual) opens this manual INSIDE the app — read it there, download it, or pop it full screen. And wherever a page is read-only for your role, a banner at the top says so and names who actually edits it; the same pages carry a small “VIEW” badge on your home screen.

Best on the warehouse iPad — installed as an app, the camera is one tap away.

TIP — Every number view has a plain-language description at the top and a “how is this calculated” section — read those before asking. Most views also export to CSV.

Home, navigation & everyday mechanics

Home is the command center: live stat chips (orders today, pending, open follow-ups...), a needs-attention line, and big launcher cards for your role. It updates in place while the data syncs — no flicker, no reload.

The sidebar has two levels: a narrow rail of areas on the left — Home, Sales, Warehouse, Finance, Planning, Admin — and, beside it, the pages of the area you picked, under their usual section headings. Nothing moved out of reach: every page is still there, the rail only chooses which slice you see. Opening a page from a card, a favourite or a link switches the rail to its area for you. On a phone the Menu shows the same areas as a row of chips.

1. Sidebar search: type in the box above the list to find any page by name — results come from every area, not just the one you are in; clear the box to return to it. Sections collapse and remember their state (Product lines starts collapsed).
2. Fast open: HQ paints from the copy saved on your device and refreshes quietly behind it, so a second visit is near-instant even on clinic wifi. The Sync button forces a live read of the sheet when you need the number right now.
3. Every page has a real URL: bookmark an account, an order, a pick list; the browser back button works; share links with teammates — they’ll see it with THEIR permissions.
4. Mobile: the bottom bar carries your essentials; the Menu button reaches every view by area, plus Settings, your manual and Sign out.
5. Themes: Healthspan (brand blue, light/dark/system) or Classic — Settings (footer button; phone: Menu → Settings).
6. Data freshness: the sheet syncs every 15 minutes; Shopify nightly at 2am; the footer shows the last sync. “Refresh” forces one.

With or without Remedy

1. Remedy is a sister company and one of our customers, and Healthspan also sells to its own staff and academy. Accounting's Sales Booked leaves both out.
2. So every sales view opens on **External only** — third-party sales, the same population accounting counts. The toolbar switch flips the whole page to **Incl. Remedy** when you want the full picture.
3. It is one setting across all the sales views, the booked chip on your home page and the Accounts list, so those pages can never show you two different answers. Every figure is labelled with which population it is.
4. The setting is yours, on this device, like the period and product-line filters.
5. On the Accounts list, External only subtracts each clinic's internal orders rather than hiding the clinic — only an account whose every order was internal drops off the list. So a real clinic that once had an order mis-tagged still shows, minus that order.

TARGETS AND COMMISSIONS — Targets and commissions are the exception: they always count external sales only, whatever the toggle says. A target is set on third-party sales and commission is paid on them, so Remedy and internal orders never move either number.

My profile — your own page

1. **My profile** sits right under Home in the sidebar; tapping your name in the footer or the phone menu opens it too.
2. It shows who you are signed in as, every finance form you have filed and where each one stands, your open follow-ups and this month's visits (if you carry a specialist tag, with a jump to your full sales page), any loaners you checked out, and the quick actions — password, manual, favourites.
3. On a phone or iPad, a small ← sits in the top bar whenever there is somewhere to go back to — and swiping right from the left edge of the screen does the same. At the bottom of the history it takes you Home.

Fulfillment — queue to doorstep

1. Fulfillment queue: every APPROVED pending order, oldest first, age-flagged. Held orders never appear — queue = cleared to ship.
2. Pick list (from the order): exact batch and bin per line, earliest expiry first (FEFO). Printable; doubles as packing slip.
3. Scan to pick: camera scan every unit against the order — wrong item red-stops, over-scan warns, progress bar per line, per-line "fill" fallback. All green → one tap writes the ledger AND fulfills the order; the specialist is pinged.
4. Confirm picked on the pick list does the same from the paper flow (offers to mark fulfilled in the same motion).
5. Delivery receipt: branded, VAT 12% split (net = ÷1.12), clinic delivery notes, signature blocks — and a permanent BIR-friendly DR number from the company series, assigned automatically the first time the DR is printed (the order keeps it forever). Record courier + waybill; mark dispatched / delivered.
6. Fulfilling or cancelling an order releases its ATP promise automatically.

Serials, loaners & waves

Serial numbers — equipment, unit by unit

1. Logistics → **Serial numbers**: one row per physical equipment unit — lasers, devices, handpieces. Add them at receiving (paste several serials at once, one per line, with the batch if there is one).
2. Each unit is in stock, on loan, sold or disposed. Consumables stay batch-tracked — serials are for the units where **which exact machine** matters.
3. Mark a unit sold with its order or DR reference; disposal asks for confirmation. Every change lands in the activity log.

Demo / loaner units

1. Logistics → **Demo / loaners**: check a serialized unit out to a clinic with a due-back date and the condition it left in. It gets an LN- number and drops out of available stock immediately, so nobody can lend or sell the same machine twice.
2. The register shows everything out, worst due date first. A loan past its due-back date turns red — and pings whoever checked it out, nightly, once per loan.
3. Return: note the condition it came back in; the serial goes back to stock. A demo that closes: → **sale** records the order reference and marks the serial sold.

Wave picking — several orders, one walk

1. In the **Fulfillment queue**, tick two or more pending orders and hit **Release wave**. The wave gets a WV- number.
2. One combined pick list: lines merged per SKU, sorted by bin, FEFO batches suggested — one walk of the warehouse instead of one list per order. The per-order split prints under each product.
3. Pull the total per SKU, sort into orders at the packing bench, then confirm each order individually — the queue and the ledger behave exactly as if each was picked alone.

Backorders — shortfalls with a life of their own

1. When a manager overrides the available-to-promise limit at order entry, the shortfall is recorded as a backorder automatically (order, SKU, units short).
2. Open backorders show at the top of the Fulfillment queue with their age.
3. Auto-release: the moment a PO receive covers the shortfall, the backorder releases itself — the warehouse and the order's specialist are both pinged that the order can now ship.
4. Cancel a backorder manually if the underlying order was cancelled.

Transfer orders — branch shipments as documents

1. New transfer: pick the branch, add the lines.
2. Dispatch: every line leaves the ledger as a FEFO batch-stamped movement (ref TR-n) — the same trail the recall trace reads. The batches used are stamped on the document.
3. Delivered closes it. In-transit units show on the view instead of living in chat threads.
4. Per-branch on-hand still isn't tracked (by design) — the document records what left, when, and in which batches.

Scan & the platform stock ledger

Logistics → Scan — camera or typed barcode, three modes:

1. Receive: books stock in with batch + expiry (also available against a PO — preferred).

2. Pick: books stock out, FEFO batch-stamped.
3. Count: records a physical observation vs the current truth (“counted 47 vs 45 — variance +2 logged”).

Everything lands in the append-only ledger (Recent movements panel shows the tail). In shadow mode the sheet remains the truth and the ledger builds evidence; after cutover the ledger IS the stock, and every view (dashboard, alerts, forecasts, ATP) reads it. Counts are observations — they never move stock by themselves; closing a cycle count writes the actual adjustments.

Cycle counts — the evidence machine

Two consecutive 100% counts are the agreed evidence for retiring the sheet. Logistics → Cycle counts:

1. Start a count: “Count everything” or a single product line.
2. It’s a BLIND count: expected quantities stay hidden so nobody anchors. Type what you physically see; blank = skipped.
3. Close & grade: the session reports matched % and unit variance; every variance writes a ledger adjustment (ref CC-n) on the record.
4. Sessions list with match badges; the last two show on the Cutover page — both 100% lights “two clean counts ✓”.

CADENCE — Count a different line each week rather than everything monthly — steadier evidence, smaller sessions, faster path to two clean counts.

Purchase orders & receiving

1. Logistics → Purchase orders: draft → ordered → partially received → received. Incoming units and next-ETA show as cards.
2. Receiving at the door: per line — quantity, batch, expiry → straight into the stock ledger with unit costs recorded.
3. The AP block on each PO (terms, proforma ref, currency, FX total, amount paid, peso value) is finance’s to fill — leave it to them.
4. The unit cost column shows for admin, finance and the warehouse team only — the same cost rule that applies everywhere else in HQ.

Quarantine & disposal — the compliance trail

Logistics → Quarantine & disposal. Stock that can’t be sold sits here — out of sellable stock and out of ATP — until someone decides.

1. Pull stock into quarantine: expiring, damaged, or QA-hold units — removed from the ledger immediately, with batch and reason on record.
2. Doubtful returned units land here too (chosen during returns receiving) — they never enter sellable stock unless released.
3. Release (after inspection): units go back into the ledger, with a note.
4. Dispose: closes the record with method/witness note, who, and when — the write-off trail for expired or damaged pharma product.
5. Cards show units held, their value at list price, and 90-day disposals.

Short-dated stock — working the shelf-life clock

Logistics → Short-dated stock. The expiry tracker tells you WHAT is running out of shelf life. This page is what we are DOING about it — every lot with units on hand expiring within six months, worst first, with the peso value at risk beside it.

1. Each lot gets a plan: discount or promo it, give it as FOC to a loyal account, transfer it to a Remedy branch, quarantine it as unsellable, or accept the write-off. Choosing "quarantine" offers to pull the units out of sellable stock immediately.
2. A plan carries an owner (who is actually doing it), a target date, and a note — which account, what discount.
3. Lots with no plan yet are flagged amber and totalled separately: that number is money nobody has decided about.
4. Done closes the lot with an outcome note, so the queue becomes a record of what was recovered and what was lost.
5. Discounts and giveaways still go through the normal promotion and order flow — this is the worklist, not a separate discount channel.

Pull-out requests — stock for internal use

Logistics → Pull-out requests. Anything leaving the warehouse that is not a sale — KOL engagements, brand campaigns, FOC promos, trade partnerships, launches and training — goes through here. It replaces the Google pull-out form, and unlike the form it actually holds the stock.

1. File a request (anyone with a login): pick the products from the catalogue — you see on-hand and available-to-promise beside each one — then quantity and unit, the fund source (the QBO class that pays for it), the reason, the product line, the date needed, and what it is for.
2. Submitting reserves the units immediately. They drop out of available-to-promise, so nobody can sell the same box while your request is pending. If there is not enough available you are warned but can still submit — the warehouse sees the shortfall.
3. The fund source approves. Only the person mapped to that class (or their named backup) can decide, and they are pinged the moment it lands. Approval notifies finance and the warehouse; a rejection comes back to you with the reason and frees the stock.
4. If you are an approver, the page opens with a banner naming the classes you own and what is waiting on you. Your approval rights come from the fund-source list, not from your access level — several approvers hold view-only access everywhere else in HQ and still approve their class normally.
5. The warehouse releases the goods — and that is the only step that moves stock: earliest-expiry-first, batch-stamped against the PL number, so a pulled lot is as traceable as a sold one.
6. Mark booked: during the parallel run the specialist still records it in Shopify; tick it here with the reference so nothing is left half-done.
7. Pull-outs are internal issues — they never count as sales, anywhere.

Finance forms

Seven forms live under Finance forms: pull-out requests, voucher for approval, request to order/pay, proof of payment, request for replenishment, expense reimbursement, and request for cash advance. They replace the Google forms and behave the same way as each other.

1. Anyone with a login can file one. Fill it in, submit, then attach the supporting documents to the row that appears in the register underneath — quotations, receipts, bank approvals, BIR forms.

2. Some sections appear only when they apply. Choosing “Pay” on a request to order/pay shows the supplier and bank fields; choosing “Order” shows the item rows instead. Only what you can see is submitted.
3. It then moves through approval steps set for that form. The register shows which step each request is on and who it is waiting for. You are told when yours is approved or rejected, and rejection always comes with the reason.
4. Nobody approves their own request — if you are the approver for a class and you file against it yourself, it goes to someone else.
5. You can cancel your own request while it is still pending, and nothing else about it.
6. Each form has its own number — V- for vouchers, RO- for requests to order/pay, PP- proofs of payment, RP- replenishments, RE- reimbursements, CA- cash advances, PL- pull-outs.

Who sees what: these carry bank details and personal claims, so the register is not open to everyone. You see your own requests, any waiting on your decision, and finance and admin see all of them. Attachments follow the same rule.

Expense reports — liquidating a revolving fund

1. For whoever holds a revolving fund. **Finance forms → Expense report**: the period covered, then one line per receipt — date, category, description, amount. The total must equal the lines, and every receipt attaches to the register row.
2. It gets an ER- number and moves through the approval steps set for this form, like every finance form. Approval clears the way to top the fund back up — that stays its own filing, the Request for replenishment.

Complaints log — quality reports with teeth

1. Anyone in the field files in seconds: account, product, batch from the box, what happened. Supply chain and management are pinged immediately.
2. The batch chip links straight into the recall trace — every other clinic that received the same lot, one tap away.
3. Statuses: open → investigating → closed. Closing requires a resolution note — the log is the compliance record and keeps everything, forever.

Warehouse KPIs — the scoreboard

1. Order cycle time: order taken → marked fulfilled (stamped automatically by pick-confirm, scan-to-pick, and status controls) — median and average over 30 days, plus the share fulfilled within 48 hours.
2. Fill rate: orders that never hit a backorder — the honest measure of stock keeping its promises.
3. Open queue: pending count, oldest age, and units picked this week.
4. The recent-fulfillments table shows each order’s cycle time color-coded (green ≤48h, amber ≤72h, red beyond).

Receiving & supplier scorecard — did we get what we ordered?

Logistics → Receiving & supplier score. Every purchase order already records units ordered and units received; this page finally reads them.

1. Fill rate: units received divided by units ordered, per supplier — graded green at 98%+, red below 75%.
2. On time: deliveries that landed on or before the ETA.
3. Lead time: the real number (PO created → fully received) sitting next to the lead time the supplier quotes us. Where the real number runs 25%+ past quoted, the reorder plan is quietly under-buying and the supplier's lead time is worth updating.
4. Receiving discrepancies: every line on a closed PO where received did not equal ordered, valued at PO cost. Short ships are claimable against the supplier; over-ships need a costing decision.

Purchase approvals — the spend gate

1. Sending a PO to a supplier commits money, so above the purchase threshold it holds instead of going out.
2. The PO stays a draft and appears in Approvals as a purchase hold, with the supplier and the value; the admins are pinged.
3. Approved → the PO is marked ordered and can be received as normal. Rejected → the PO is cancelled with the reason on record.
4. The threshold is set on the Approvals page and is a super-admin setting, like the big-order limit for sales.

Suppliers, imports & multi-currency

1. Supplier master (Logistics → Suppliers & imports): every supplier with currency, payment terms, lead time in days, and contacts. Lead times sharpen ordering judgment — the forecast assumes ~2 months when unset.
2. On the water: every ordered/partial PO with an ETA, sorted soonest-first, with its customs status pill.
3. Import tracking per PO: ETD, ETA, customs status (in transit / clearing / cleared / delivered), and broker — edited right on the purchase order.
4. Multi-currency: the PO carries its currency, invoice total, amount paid, and the FX rate at payment — which converts foreign costs into real ₱ for the valuation page.
5. QA hold at receiving: when booking a delivery in, choose SELLABLE (straight to the ledger) or QA HOLD (quarantined until inspection releases it — released units enter the ledger as receives).

Recall trace & product registrations

1. Batch recall trace (Logistics): type a SKU/batch → every clinic that received it with dates and quantities — OUT-sheet history plus ledger picks, so it survives the sheet's retirement. Printable contact list in seconds.
2. Product registrations (Inventory): CPR/FDA type, number, expiry per SKU. Expired shows red ("EXPIRED Nd ago"), within 6 months amber countdown — both float to the top. Read-only for your role — flag renewals to finance/admin.

The inventory command center

1. Dashboard: KPI cards, running-out-in-30-days, category split, out-of-stock commercial, expiring-in-3-months.
2. Action center: everything needing action today, prioritized — the daily to-do.

3. All SKUs: sortable master list; tap for the product drawer (batches, 13-month trend, deals, forecast).
4. Alerts: out of stock · low stock · negative stock · expiry tracker · reorder alerts — each with exact SKUs and quantities.
5. Planning: stockout forecast (trend + seasonal velocity) · stock coverage · reorder plan · reorder point · demand variability (CV classes) · ABC analysis · write-off forecast.
6. Batch view: every batch with expiry and bin, FEFO-ordered — the same data behind pick lists and recall.
7. Data health: feed freshness, price≠Shopify and stock≠Shopify reconciliation — the system tells you when to distrust its own feed.

Finance views: aged inventory · shrinkage tracker · cash in expiring stock — inventory as money.

Logistics views: Remedy branch shipments log · branch expiry watch.

Every view: plain-language description, “how is this calculated”, CSV export, full peso figures.

The ten simulators

Simulator	What it answers
What-if	Change price/velocity/lead time on one SKU — see stockout and cash effects
Promo rescue	Can a promo clear at-risk stock before it expires, and at what discount?
Budget optimizer	Best allocation of a fixed buying budget across SKUs
Service level	Safety stock needed for a chosen fill rate
Campaign surge	What a campaign’s uplift does to stock coverage
Monte Carlo stockout risk	Thousands of demand scenarios → probability of stockout per SKU
12-month projection	Stock trajectory a year out under current velocity
Cash-flow timeline	What the buying plan does to cash, month by month
Bulk-buy trade-off	Volume discount vs holding/expiry risk
Branch rebalancing	Which Remedy branch stock should move where

Each is one click, live data, with its method explained under the result.

Forecasting & the AI layer

1. Stockout forecast: trend + seasonal velocity per SKU; campaign windows banner it so promos stop being surprises.
2. Forecast accuracy (MAPE): each month’s forecast is frozen automatically, then scored against actual movement — MAPE and bias per month, worst misses ranked. The forecast grades itself.
3. AI planning review: one click walks every SKU, campaigns, and recent misses → an exception report with 5 prioritized actions and quantities.
4. Ask Healthspan: plain-language questions over live inventory, sales by week and month, accounts, targets and specialists, in-app or Slack (/stock), any hour.

The orders register & order pages

Every order ever — native HS orders plus the full migrated Shopify history (8,900+) — searchable, paginated (50/100/250 per page). You see everything.

1. Search & pages: the register is served page-by-page from the database — search by account, specialist, or order number (HS-1042 works); 50/100/250 per page.
2. Tap an order for its full page: lines, status, shipment panel (courier, waybill, dispatched/delivered), payment panel (paid, balance, terms), notes.
3. Statuses: pending → fulfilled, or cancelled. Held orders show an approval banner until decided.
4. Printables from the order page: FEFO pick list / packing slip, and the branded Delivery Receipt with VAT split, the clinic's delivery notes, and signature blocks.

When the bell pings you

The bell pings only the person who ACTS — nobody is copied on someone else's action items. The queues themselves are always open in-app for anyone with access.

You get pinged when...	What to do	Where it takes you
A new order is approved and ready to pick	It's already on your queue, batches chosen	Fulfillment queue
A pull-out is approved	Release the stock when ready — releasing is what moves the ledger	Pull-out requests

Business review — the monthly report, generated

1. Sales analytics → **Business review**: the monthly sales performance report computed from HQ — at a glance, brands vs target with a 13-month chart, products per brand, machines and demo units, accounts monitoring, clients & buying behaviour, one panel per specialist, then the plan. Pick the month at the top; figures are external sales only, as on Targets.
2. Every section is readable; the commentary boxes are written by the sales manager and by each specialist, so on this page they are view-only for you. The figures are the same as Targets and Scorecards — external sales only.
3. Sales analytics → **Reports** → **Copy for Notion — Supply chain**: inventory value by line at Healthspan price, out-of-stock count, batches expiring within three months and equipment on hand, as text that pastes into your section of the weekly meeting page.
4. **Settings** (footer or phone menu) holds theme and light/dark mode, Change password, Sign out, favourites, the bottom bar and your manual.

The warehouse week

1. Daily: queue top-to-bottom, oldest first; scan every pick.
2. Receiving days: book against the PO with batch + expiry at the door.
3. Weekly: one cycle-count scope — build toward two clean counts.
4. Keep the sheet updated as normal until the Cutover page says otherwise.

Something looks wrong? Check Data health first (feed freshness and reconciliation), then tell the super admin. The app ships improvements weekly — if a step in this manual moved, it moved somewhere better.
