1 • Getting started

HQ never uses the browser's own pop-up boxes any more. Every question, confirmation and message appears as an HQ dialog inside the app — Enter confirms, Escape cancels, and a form asks its questions in one box instead of one after another.

Sign in

1. Open hq.healthspan.ph in any browser (Safari, Chrome — phone, iPad, or computer).
2. Enter your Healthspan email and password. Tick Remember me on your own device; leave it unticked on shared computers.
3. Forgot your password? Ask an admin — they can set a new one in seconds. You can change it anytime from Settings (footer button; phone: Menu → Settings).

Install it as an app (do this once)

1. On iPhone/iPad: open hq.healthspan.ph in Safari → tap Share → Add to Home Screen.
2. On Android: open it in Chrome → menu : → Add to Home screen.
3. It now opens full-screen like a real app, with the Healthspan icon.
4. Make the bottom bar yours: Menu → ☆ Customize bar — pick the pages you use most for one-tap access. Home and Menu are always there (specialists also keep Log visit and New order fixed, with 2 free slots; everyone else picks 4).

Your favourites

1. Star any page from the ☆ in the top bar. It pins to the top of the sidebar, directly under Home, and to the top of your home page — one list, both places — and it follows your account, so the iPad, the phone and the laptop show the same favourites.
2. Prefer to set them all at once? **Choose favourites** — the edit link on the home row, or Menu → Choose favourites on a phone — opens the full picker. Up to **10**.
3. The Favourites heading in the sidebar collapses and expands like every other section, and remembers which way you left it.
4. They are yours, on this device, the same as the bottom bar — and only pages your role can open are ever offered.

Sorting any table

Click any column heading to sort A-Z; click it again for Z-A. It works on every table in HQ. Money, quantities, dates and expiry months sort by their real value, not alphabetically, and blank cells always go to the bottom. Section headings and TOTAL lines stay put. The sort lasts until the page redraws — it is a way to look at what is on screen, not a saved setting.

When a page refreshes

After you do something — add a line, submit a form, approve, release — the page updates in place. It does not blank out or jump back to the top; whatever you were looking at stays put while the new numbers land. You only see a "Loading" message when you open a page for the first time.

Attaching files

Where you see + Attach, you can add files straight from your phone or computer — photos, quotations, receipts, signed slips. They are stored in the Healthspan Google Drive, and opening one goes back through HQ, so your access here decides what you can see. Anything over about 4 MB opens in Drive instead. Remove a file with the × beside it.

1. On an account: the **Documents** panel on the profile page, so a clinic's own paperwork lives with the clinic.

2. On a pull-out request: the register row underneath the form.
3. On any of the seven finance forms: the register row that appears once you submit — quotations, receipts, bank approvals, BIR forms.
4. A file can only be removed by whoever uploaded it (or by whoever runs that area). Removing it deletes it from Drive too, so the × asks first.

The bell

The bell at the top pings you when the system needs you — a red badge shows unread items. Tap it to see what happened and jump straight to the right page. It checks for news every 90 seconds. What pings whom is listed at the end of this manual.

Ask Healthspan

The Ask Healthspan button (top bar) answers plain-language questions over everything HQ knows — inventory, sales, receivables, cheques, approvals, backorders, quotes, pipeline — and its knowledge is automatically scoped to YOUR role: specialists get their own numbers, costs and margins only answer for finance and admin. Any hour, in the app or on Slack (/stock). A small dropdown in the drawer header lets you choose which model answers — Gemini Flash (default) or Claude Haiku — and remembers your pick on this device. It is also a full page — Home → Ask Healthspan, or  in the drawer — that keeps every conversation: your chats on the left (search, rename, delete), the thread on the right. Chats are yours alone; nobody else can open them. Settings → Shortcuts chooses which one the top-bar button opens.

Your manual & view-only pages

The manual link at the bottom of the sidebar (phone: Menu → My manual) opens this manual INSIDE the app — read it there, download it, or pop it full screen. And wherever a page is read-only for your role, a banner at the top says so and names who actually edits it; the same pages carry a small “VIEW” badge on your home screen.

You hold the circle read plus full control of campaigns and promotions.

TIP — Every number view has a plain-language description at the top and a “how is this calculated” section — read those before asking. Most views also export to CSV.

Home, navigation & everyday mechanics

Home is the command center: live stat chips (orders today, pending, open follow-ups...), a needs-attention line, and big launcher cards for your role. It updates in place while the data syncs — no flicker, no reload.

The sidebar has two levels: a narrow rail of areas on the left — Home, Sales, Warehouse, Finance, Planning, Admin — and, beside it, the pages of the area you picked, under their usual section headings. Nothing moved out of reach: every page is still there, the rail only chooses which slice you see. Opening a page from a card, a favourite or a link switches the rail to its area for you. On a phone the Menu shows the same areas as a row of chips.

1. Search — the box above the sidebar list finds pages AND records. Type part of a page name, a product (code or name), an account, a specialist, an order number (HS-1042), a pull-out (PL-1003), a complaint or the number of a finance request you filed and the hits appear grouped — only records this role may open. Pick a result to open it: orders, accounts and specialists open their own page, a product opens its detail panel, and a list record lands on its list with the row scrolled into view and flashed. ⌘K (Ctrl+K on Windows) puts the cursor in the box. On a phone the box is at the top of the Menu; a detail panel closes with ← in the top bar, its own ← Back / ×, a left-edge swipe, or any bottom tab — none of them can leave you stuck on it.

2. Fast open: HQ paints from the copy saved on your device and refreshes quietly behind it, so a second visit is near-instant even on clinic wifi. **Sync now**, at the bottom of the sidebar under the Synced timestamp (Sync in the phone bar), forces a live read of the sheet when you need the number right now; otherwise the data refreshes itself every 15 minutes.
3. Every page has a real URL: bookmark an account, an order, a pick list; the browser back button works; share links with teammates — they'll see it with THEIR permissions.
4. Mobile: the bottom bar carries your essentials; the Menu button reaches every view by area, plus Settings, your manual and Sign out.
5. Themes: Healthspan (brand blue, light/dark/system) or Classic — Settings (footer button; phone: Menu → Settings).
6. Data freshness: the sheet syncs every 15 minutes; Shopify nightly at 2am; the footer shows the last sync. "Refresh" forces one.

Org chart — who reports to whom

Org chart (right under My profile in the sidebar) shows who reports to whom across Healthspan Global — names, titles and the reporting line, as the People team keeps it; colours mark co-founders, managers, leads, associates, part-timers and interns, and a dashed box is a vacant post. Tap any name to open the person's card: their title, who they report to, who reports to them, and the pages HQ has for them (a product specialist's sales page, for those who may open it). Find a name or title with the box above the chart; on a phone the chart is an indented list, and Tree / List switches the layout anywhere. It carries no pay and no costs — names and titles only. People Operations keep it up to date in HQ; tell them when something changes.

My profile — your own page

1. **My profile** sits right under Home in the sidebar; tapping your name in the footer or the phone menu opens it too.
2. It shows who you are signed in as, every finance form you have filed and where each one stands, your open follow-ups and this month's visits (if you carry a specialist tag, with a jump to your full sales page), any loaners you checked out, and the quick actions — password, manual, favourites.
3. On a phone or iPad, a small ← sits in the top bar whenever there is somewhere to go back to — and swiping right from the left edge of the screen does the same. At the bottom of the history it takes you Home.

Campaigns & the promotions engine

Campaign calendar

1. Each campaign: name, window, expected uplift, SKUs. Marketing adds and removes campaigns here alongside admins and sales managers; everyone else sees the calendar read-only. It is a demand signal: the stockout forecast banners it and the AI review weighs it.
2. On start day the field team is pinged automatically.

Promotions engine (you configure)

1. Name (shows on order lines) · start/end window · eligible SKUs (comma list, or * for all).
2. Mechanic: Buy N get M free (free units auto-added) or % off (unit price discounted).
3. While LIVE it applies automatically in order entry AND quotations, every line tagged with the promo name — measurable in Sales overview.
4. Turn off / delete anytime; past orders keep their tagged lines.

Reorder due, pipeline & events

Reorder due

1. The system computes each clinic's median reorder cycle from its real history.
2. Accounts 25%+ past their cycle appear here — routed to each owner; you see everyone.
3. One tap: log the visit or start the order. Going-quiet alerts follow the account's TIER: A = 30 days, B = 45, C = 60 — an important clinic gets flagged three times sooner.
4. Your 3 best calls: Monday mornings the bell brings each specialist their three highest-value accounts drifting past their rhythm — ranked by six-month value × how overdue.

Pipeline & opportunities

1. Stages: lead → contacted → qualified → active, seeded from real behavior; every move is audited; losses need a reason.
2. Opportunities: estimated value + expected close date per card; the header shows weighted pipeline (25/50/75/85%) and win rate.
3. Prospects convert with one tap from the Prospects tab.

Events calendar

One month grid merging campaigns, planned visits, and demo/training days across the team. The weekly Calendar of Events, live.

Sales analytics — the scoreboard

1. Sales overview: units and value for any period (today → 12 months → custom), split deals vs à-la-carte vs true giveaways, charts included.
2. Monthly by SKU: the whole year on one page — January to December across, every SKU down under its product line with a subtotal, then the year total and the stock left now. Show units and pesos together or either alone, pick the year or a line, fold a line by clicking it, and Export CSV for the full grid.
3. Sales vs target: monthly attainment by total, brand line, product, and specialist — the 245-row corporate target file, or in-app targets when set.
4. Per-specialist drill-downs and profile pages with month calendars.
5. Field coverage: contacts/day, accounts reached vs the whole universe, not-reached ranked by value.
6. Vs accounting: continuous peso-for-peso reconciliation to the official Sales Report.
7. Leaderboard & pace: MTD race + projected month-end attainment per specialist — the mid-month coaching tool.

Baked-in conventions: deal +1s are deal units (not free); "free" = ₱0 outside any deal; pull-outs and TEST never count as sales; native orders fold into sales totals only at cutover (no double counting).

With or without Remedy

1. Remedy is a sister company and one of our customers, and Healthspan also sells to its own staff and academy. Accounting's Sales Booked leaves both out.
2. So every sales view opens on **External only** — third-party sales, the same population accounting counts. The toolbar switch flips the whole page to **Incl. Remedy** when you want the full picture.
3. It is one setting across all the sales views, the booked chip on your home page and the Accounts list, so those pages can never show you two different answers. Every figure is labelled with which population it is.

4. The setting is yours, on this device, like the period and product-line filters.
5. On the Accounts list, External only subtracts each clinic's internal orders rather than hiding the clinic — only an account whose every order was internal drops off the list. So a real clinic that once had an order mis-tagged still shows, minus that order.

TARGETS AND COMMISSIONS — Targets and commissions are the exception: they always count external sales only, whatever the toggle says. A target is set on third-party sales and commission is paid on them, so Remedy and internal orders never move either number.

CRM activity — visits & calls per specialist

1. Sales analytics → **CRM activity**: the field effort itself, per specialist — visits, calls, demos, accounts touched, active days, and how often a contact ends in an order, with a 13-week trend.
2. Calls are the call / follow-up / Viber quick-log visit types; everything else counts as a field visit. Planned visits count once they are done.
3. It reads the in-app visit log, so it is only as good as the logging discipline — activity is the input, the Sales views measure the output.

Business review — the monthly report, generated

1. Sales analytics → **Business review**: the monthly sales performance report computed from HQ — at a glance, brands vs target with a 13-month chart, products per brand, machines and demo units, accounts monitoring, clients & buying behaviour, one panel per specialist, then the plan. Pick the month at the top; figures are external sales only, as on Targets.
2. **What HQ noticed** is written by the page from the figures — pace against target, brands ahead and behind, first orders, repeat accounts going quiet, specialists on and off pace, activity that has not turned into orders. It re-reads the same way every time; the story behind the numbers goes in the commentary boxes.
3. Every section is readable; the commentary boxes are written by the sales manager and by each specialist, so on this page they are view-only for you. The figures are the same as Targets and Scorecards — external sales only.
4. **Settings** (footer or phone menu) holds theme and light/dark mode, Change password, Sign out, favourites, the bottom bar and your manual.

Saved reports — your own reports, on a schedule

Sales analytics → **Saved reports** is the report builder: pick a source, tick the columns you want, add filters, group and total, sort by clicking a header, and save it under a name. Run it whenever, export the CSV, or put it on a schedule and let HQ run it for you.

Building one

1. **+ New report**, name it, choose a **source**. Yours are: stock on hand, batches & expiry, sales lines, accounts and visits.
2. Tick the **columns** (none ticked = the first eight). Add **filters** — text (equals, contains, in a list), numbers (greater / less than), dates (on, after, before, last N days, this month, last month, this year). All filters must match.
3. **Group by** a column to get one row per value with a count and any totals you add (sum, average, min, max of a number column). Click a header in the preview to sort; the row cap keeps very large results sane.
4. The **preview** updates as you build (first 200 rows on screen; the export has everything). **Save**, then **Export CSV** opens in Excel or Sheets.

Scheduling and sharing

1. Set the schedule to **every day, every week** (pick the weekday) **or every month** (pick the day, or the last day). At **6am Manila** the server runs the report as you and files the CSV under **Runs on the server**; the bell tells you it is ready. Nothing is e-mailed — the file stays inside HQ.
2. **Run on the server now** proves a schedule before waiting for the morning. Each run keeps its own CSV, so last week's numbers stay downloadable next to this week's.
3. Tick **Shared** to let everyone who may read that source open the report; they can run and export it, only you (or an admin) can change or delete it.

THE SAME RULES AS EVERY PAGE — a specialist who opens a shared report sees only their own rows; cost figures appear only for the roles that see costs elsewhere, in the preview and in the scheduled file alike. A schedule can never show more than the person who saved it could see.

Accounts (CRM) — one memory per clinic

One row per customer, merged across the OUT sheet, Shopify, and the visit log. Tap any row for the full profile page.

The account page

1. KPI cards (booked, shipped, momentum, visits) · health score 0–100 with its reasons · merged clickable timeline (orders open) · what-they-buy · “worth offering next” upsell panel mined from co-purchase history.
2. Details (Edit): contact person, phone, email/Viber, address, region & city, clinic type, specialty, tier A/B/C, source, delivery notes (these print on the DR), doctor's birthday & clinic anniversary, LTO/PRC licenses with red/amber expiry pills, notes.
3. Contacts: doctor / purchaser / nurse with phone, email, Viber — add or remove inline.
4. Credit line: limit and open balance, right where you quote from.
5. Quick actions: + New order · + Log visit · Call / Viber quick-log (a phone touch counts like a visit — timeline, coverage, and the going-quiet alert all see it) · Statement.
6. Documents: quotations, signed DRs, clinic paperwork — attached to the account itself, so they are still there when the next person opens it.

Short-dated stock — working the shelf-life clock

Logistics → Short-dated stock. The expiry tracker tells you WHAT is running out of shelf life. This page is what we are DOING about it — every lot with units on hand expiring within six months, worst first, with the peso value at risk beside it.

1. Each lot gets a plan: discount or promo it, give it as FOC to a loyal account, transfer it to a Remedy branch, quarantine it as unsellable, or accept the write-off. Choosing “quarantine” offers to pull the units out of sellable stock immediately.
2. A plan carries an owner (who is actually doing it), a target date, and a note — which account, what discount.
3. Lots with no plan yet are flagged amber and totalled separately: that number is money nobody has decided about.
4. Done closes the lot with an outcome note, so the queue becomes a record of what was recovered and what was lost.
5. Discounts and giveaways still go through the normal promotion and order flow — this is the worklist, not a separate discount channel.

Pull-out requests — stock for internal use

Logistics → Pull-out requests. Anything leaving the warehouse that is not a sale — KOL engagements, brand campaigns, FOC promos, trade partnerships, launches and training — goes through here. It replaces the Google pull-out form, and unlike the form it actually holds the stock.

1. File a request (anyone with a login): pick the products from the catalogue — you see on-hand and available-to-promise beside each one — then quantity and unit, the fund source (the QBO class that pays for it), the reason, the product line, the date needed, and what it is for.
2. Submitting reserves the units immediately. They drop out of available-to-promise, so nobody can sell the same box while your request is pending. If there is not enough available you are warned but can still submit — the warehouse sees the shortfall.
3. The fund source approves. Only the person mapped to that class (or their named backup) can decide, and they are pinged the moment it lands. Approval notifies finance and the warehouse; a rejection comes back to you with the reason and frees the stock.
4. If you are an approver, the page opens with a banner naming the classes you own and what is waiting on you. Your approval rights come from the fund-source list, not from your access level — several approvers hold view-only access everywhere else in HQ and still approve their class normally.
5. The warehouse releases the goods — and that is the only step that moves stock: earliest-expiry-first, batch-stamped against the PL number, so a pulled lot is as traceable as a sold one.
6. Mark booked: during the parallel run the specialist still records it in Shopify; tick it here with the reference so nothing is left half-done.
7. Pull-outs are internal issues — they never count as sales, anywhere.

Finance forms

Seven forms live under Finance forms: pull-out requests, voucher for approval, request to order/pay, proof of payment, request for replenishment, expense reimbursement, and request for cash advance. They replace the Google forms and behave the same way as each other.

1. Anyone with a login can file one. Fill it in and **add the supporting documents before you submit** — the form has an Add file / Add receipt control that takes photos straight from a phone camera, or PDFs. They upload the moment the request is filed; you can still add more from the row in the register afterwards.
2. **Expense reimbursement** and **Expense report (revolving fund)** will not submit without at least one receipt — finance cannot process a line without one, so the form does not let it leave without one either.
2. Some sections appear only when they apply. Choosing “Pay” on a request to order/pay shows the supplier and bank fields; choosing “Order” shows the item rows instead. Only what you can see is submitted.
3. It then moves through approval steps set for that form. The register shows which step each request is on and who it is waiting for. You are told when yours is approved or rejected, and rejection always comes with the reason.
4. Nobody approves their own request — if you are the approver for a class and you file against it yourself, it goes to someone else.
5. You can cancel your own request while it is still pending, and nothing else about it.
6. Each form has its own number — V- for vouchers, RO- for requests to order/pay, PP- proofs of payment, RP- replenishments, RE- reimbursements, CA- cash advances, PL- pull-outs.

Who sees what: these carry bank details and personal claims, so the register is not open to everyone. You see your own requests, any waiting on your decision, and finance and admin see all of them. Attachments follow the same rule.

Expense reports — liquidating a revolving fund

1. For whoever holds a revolving fund. **Finance forms → Expense report**: the period covered, then one line per receipt — date, category, description, amount. The total must equal the lines, and every receipt attaches to the register row.
2. It gets an ER- number and moves through the approval steps set for this form, like every finance form. Approval clears the way to top the fund back up — that stays its own filing, the Request for replenishment.

The inventory command center

1. Dashboard: KPI cards, running-out-in-30-days, category split, out-of-stock commercial, expiring-in-3-months.
2. Action center: everything needing action today, prioritized — the daily to-do.
3. All SKUs: sortable master list; tap for the product drawer (batches, 13-month trend, deals, forecast).
4. Alerts: out of stock · low stock · negative stock · expiry tracker · reorder alerts — each with exact SKUs and quantities.
5. Planning: stockout forecast (trend + seasonal velocity) · stock coverage · reorder plan · reorder point · demand variability (CV classes) · ABC analysis · write-off forecast.
6. Batch view: every batch with expiry and bin, FEFO-ordered — the same data behind pick lists and recall.
7. Data health: feed freshness, price≠Shopify and stock≠Shopify reconciliation — the system tells you when to distrust its own feed.

Every view: plain-language description, “how is this calculated”, CSV export, full peso figures.

The ten simulators

Simulator	What it answers
What-if	Change price/velocity/lead time on one SKU — see stockout and cash effects
Promo rescue	Can a promo clear at-risk stock before it expires, and at what discount?
Budget optimizer	Best allocation of a fixed buying budget across SKUs
Service level	Safety stock needed for a chosen fill rate
Campaign surge	What a campaign’s uplift does to stock coverage
Monte Carlo stockout risk	Thousands of demand scenarios → probability of stockout per SKU
12-month projection	Stock trajectory a year out under current velocity
Cash-flow timeline	What the buying plan does to cash, month by month
Bulk-buy trade-off	Volume discount vs holding/expiry risk
Branch rebalancing	Which Remedy branch stock should move where

Each is one click, live data, with its method explained under the result.

Recall trace & product registrations

1. Batch recall trace (Logistics): type a SKU/batch → every clinic that received it with dates and quantities — OUT-sheet history plus ledger picks, so it survives the sheet's retirement. Printable contact list in seconds.
2. Product registrations (Inventory): CPR/FDA type, number, expiry per SKU. Expired shows red ("EXPIRED Nd ago"), within 6 months amber countdown — both float to the top. Read-only for your role — flag renewals to finance/admin.

Forecasting & the AI layer

1. Stockout forecast: trend + seasonal velocity per SKU; campaign windows banner it so promos stop being surprises.
2. Forecast accuracy (MAPE): each month's forecast is frozen automatically, then scored against actual movement — MAPE and bias per month, worst misses ranked. The forecast grades itself.
3. AI planning review: one click walks every SKU, campaigns, and recent misses → an exception report with 5 prioritized actions and quantities.
4. Ask Healthspan: plain-language questions over live inventory, sales by week and month, accounts, targets and specialists, in-app or Slack (/stock), any hour.

When the bell pings you

The bell pings only the person who ACTS — nobody is copied on someone else's action items. The queues themselves are always open in-app for anyone with access.

You get pinged when...	What to do	Where it takes you
A campaign you configured goes live	Watch uptake in Sales overview from day one	Campaigns
A promo goes live	Order entry is applying it automatically	Promotions

Something looks wrong? Check Data health first (feed freshness and reconciliation), then tell the super admin. The app ships improvements weekly — if a step in this manual moved, it moved somewhere better.

Your pages — the complete directory

Every page this manual's role can open in HQ, in sidebar order, with what each one is for. If a page is not listed here, your role does not have it. Where a page shows a view-only banner, the editing role is named on the page itself.

Home

Page	What it is for
My profile	Your own page — who you are signed in as, the finance forms you have filed and where each one stands, your open follow-ups, loaners you checked out, and the quick actions (password, manual, favourites) without digging through menus.
Org chart	Who reports to whom across Healthspan Global — names, titles and the reporting line, as the People team keeps it. Tap a name for the person's card and their pages in HQ.

Ask Healthspan	Ask Healthspan as a full page: your saved chats on the left, the conversation on the right. Same brain as the side chat — stock, sales, accounts, targets, in plain language.
----------------	---

Sales & CRM

Page	What it is for
Orders	The register of every HQ order — status, amount, paid and balance, shipment marks — with a full page per order.
Follow-ups & planned visits	The team's to-do list, generated by the visit log: every visit whose outcome was Follow-up needed stays here until ticked done, and every visit logged with a future date shows as a planned visit (overdue ones flagged). Specialists see their own; managers and admins see everyone's.
Accounts (CRM)	Who Healthspan sells to — accounts ranked by value, order cadence, and whether they're growing, declining, or dormant. Also shows how concentrated you are on Remedy.

Sales analytics

Page	What it is for
Sales overview	Use External only / Incl. Remedy in the toolbar to switch the whole page between third-party sales and everything.
Monthly sales by SKU	One year on one page: January to December across, every SKU down, grouped under its product line with a subtotal row, then the year total and the stock left now. Show units and pesos together, or either alone; pick the year and the line, find a SKU, fold a line by clicking it.
Sales vs target	External sales only — Remedy and Healthspan-internal orders never count toward a target. Actual booked sales versus the monthly targets set in the sheet's Targets tab — total, per line, and per product.
Sales per specialist	Each product specialist's booked sales — revenue and units — over an adjustable period, and against their monthly target if one is set. Specialists are read from the order's first tag in Shopify (e.
Leaderboard & pace	The month-to-date race and the finish-line projection. Pace = what you've booked ÷ how much of the month has passed, against your target — green means on pace for 100%.
Reorder due	Accounts past their usual buying rhythm. The cycle is learned from each account's own order history (median gap between orders, 3+ orders needed).
Pipeline	The funnel, staged: lead → contacted → qualified → active. Stages start from real behavior and every manual move is audited.
Events calendar	One calendar for the room: campaigns, demos, trainings, and planned visits in a single month grid — Mench's weekly Calendar of Events, live. Specialists see their own visits; everyone sees campaigns.
Quotations	Formal quotations for clinics: build a quote with the same pricing as an order, print it, mark it sent/accepted/lost, and convert an accepted quote to an order in one tap. Win rate is tracked from outcomes.
Deals vs à la carte	Do the bundles outsell single-unit pricing? Per product: units and revenue moved through deals versus à la carte, the effective per-unit price inside a deal (revenue ÷ all units including the +1), and the effective discount versus the à-la-carte price.

Free items	Items given away at ₱0 outside any deal — samples, marketing, goodwill — kept separate from sales. Deal +1s are not here; they count as deal units.
CRM activity	The field effort itself, per specialist: visits, calls, demos, accounts touched, and how often a contact ends in an order — from the in-app visit log. Sales activity is the input; the Sales views measure the output.
Field coverage	Veeva-style field activity per specialist, built from bookings: how many accounts each specialist reached in the period vs their own account universe (≈6 months), orders per active day, samples given, and — most useful — the accounts not reached list, sorted by value, as a ready follow-up sheet. A booking counts as contact; visits without an order would need a call log (phase 2).
Business review	The monthly sales performance report, built from HQ instead of typed into slides: brands, products, machines, accounts, buying behaviour and each specialist, with what HQ noticed in the numbers. People add only the commentary — the sales manager owns the wins / challenges / plan boxes, each specialist owns their own — and every box shows what it said last time.
Reports	Every review deck for the month, built from live figures the moment you click: the team deck for the sales manager, one deck per specialist, PowerPoint or PDF. The Inputs column says whose commentary is in before anyone downloads.
Saved reports	Your own reports, the way NetSuite people mean it: pick a source (stock, batches, sales lines, HQ orders, accounts, visits, quotes, payments, POs, finance forms, serials, loaners), tick columns, add filters, group and total, sort — and save it. Run it any time, export the CSV, or schedule it daily / weekly / monthly: at 6am Manila the server runs it as you and drops the CSV in HQ with a bell notification.

Logistics

Page	What it is for
Remedy branch shipments	A log of product Healthspan has shipped to Remedy's clinic branches — BGC, Vertis North, Greenhills — from 2025 onward. Remedy is a sister company and a customer.
Remedy branch expiry watch	For each Remedy branch, the stock Healthspan shipped there sorted by expiry — so each clinic can see what to use up first.
Short-dated stock	The worklist for stock that is running out of shelf life: every batch with units on hand expiring within six months, worst first, with the peso value at risk. Each lot gets a plan — discount it, give it as FOC to a loyal account, transfer it to a Remedy branch, quarantine it, or accept the write-off — an owner, and a target date, so expiring money is worked instead of watched.
Warehouse KPIs	The warehouse scoreboard: order cycle time (taken → fulfilled), share fulfilled within 48 hours, fill rate (orders that never hit a backorder), the open queue, and units picked this week.
Serial numbers	One row per physical equipment unit — lasers, devices, handpieces — tracked by serial number from receiving through loan, sale or disposal. Consumables stay batch-tracked; serials are for the units where which exact machine matters.
Demo / loaner units	Demo and loaner equipment out with clinics: who has which serial, since when, due back when. Overdue loans ping whoever checked the unit out.

Batch recall trace	The one-bad-day feature: enter a SKU and/or batch number and get every clinic that ever received it — dates, quantities, order refs — as a printable contact list. Sources: every OUT-sheet shipment row plus the platform ledger.
Complaints log	Product quality reports with the batch on record — one tap into the recall trace shows every other clinic that received the same lot. Closing a complaint requires a resolution note; the log is the compliance record.

Finance forms

Page	What it is for
Pull-out requests	Inventory pull-outs — stock leaving the warehouse for internal use (KOL engagements, campaigns, FOC promos, trade partnerships, launches and training) charged to a department's fund source. Anyone can file a request; the fund source named on it approves.
Voucher for approval	Voucher for approval — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request to order / pay	Request to order / pay — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Proof of payment	Proof of payment — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request for replenishment	Request for replenishment — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Expense report (revolving fund)	Expense report — the liquidation of a revolving fund. Whoever holds a fund itemises every peso spent in the period, receipt by receipt, and it routes to the approver set for this form (Admin → Approval routes).
Expense reimbursement	Expense reimbursement — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request for cash advance	Request for cash advance — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.

Finance

Page	What it is for
AR aging — receivables	Who owes what, and for how long: every unpaid balance bucketed into current / 31-60 / 61-90 / 90+ days, per account. Ages count from the order date plus any terms noted on the order (e.
Cash-flow forecast	Expected collections, week by week: receivables land in the week their payment terms mature, post-dated cheques in the week they can be deposited. Overdue money gets its own bucket.
Aged inventory	Products that haven't sold in a while, grouped into aging, slow, and dead stock — candidates for a promo or clear-out.
Shrinkage tracker	Flags gaps between what was received/sold and what's actually on hand — possible loss, miscounts, or unrecorded movement.

Cash in expiring stock	The peso value tied up in stock that's expiring soon, bucketed by urgency.
------------------------	--

Inventory

Page	What it is for
Dashboard	Your at-a-glance overview — total stock, what's running out, what's expiring, and value by product line. A good place to start each day.
Action center	Your daily to-do in one place — what to order now, what to promo or move before it expires, what to review, and dead stock to clear. Pulls together the whole app so nobody has to hunt across tabs.
All SKUs	Every product in one searchable table. Filter by line or category and click any row for full detail.
Batch view	Every batch in FEFO order (first to expire, first out) — the sequence to pull stock in.
Item master	The item master — products, prices, costs, and barcodes owned in-app. While in shadow mode, Shopify still prices the app; use this page to fix drift (⚠ rows) and add costs, then declare pricing independence on the Cutover switches page.
Product registrations	CPR/FDA product registrations per SKU with expiry dates — expired and expiring-soon registrations float to the top so renewals never slip.

Alerts

Page	What it is for
Out of stock	Products that have hit zero stock — these need reordering now.
Low stock	Products with fewer than 10 units left — running thin.
Negative stock	Products showing negative stock, which usually points to a miscount or data slip worth checking.
Expiry tracker	Batches sorted by expiry date, soonest first. Use it to decide what to sell or use up before it expires.
Reorder alerts	Products that have dropped below their reorder point (or a threshold you set) and should be reordered.

Planning

Page	What it is for
Stockout forecast	Predicts when each product will run out, using recent sales trend and seasonality. Order the red ones first.
Stock coverage	How much runway you have — weeks or months of stock left at the current sales pace, per product. The chart groups SKUs from critically low to overstocked; the list ranks them lowest-cover first.
Reorder plan	Turns the forecast into a shopping list — how much to order of each item and the estimated cost. Adjust lead time and coverage up top, then export a draft PO.
Reorder point	The “buy-again” level for each product, based on how fast it sells and how erratic demand is. Stock at or below the reorder point means it's time to order.

Demand variability	Sorts products into steady, variable, and lumpy by how consistent their sales are — so you know which forecasts to trust and which need a human eye.
ABC analysis	Ranks products by how much of your sales value they drive. A-items are the vital few to watch and count most closely.
Write-off forecast	Estimates how much stock will expire unsold at the current pace, and the peso value at risk. Tackle the biggest ones first.
Forecast accuracy	The honest test of the forecast: at the start of each month the model's prediction per SKU is frozen; a month later it's scored against what actually moved. MAPE = average % miss per SKU.
Campaign calendar	Planned promos and campaigns as a demand signal. Anything added here shows as a banner on the stockout forecast and feeds the AI planning review, so a "10+8 anniversary promo" stops being a forecast surprise.
Promotions	Promotions as configuration instead of free-typed deal lines: define a mechanic (buy-N-get-M free, or % off), a validity window, and the eligible SKUs — order entry applies it automatically while the promo is live.
AI planning review	Demand planning AI: walks every SKU (stock, velocity, days-to-stockout, expiry) plus the campaign calendar and recent forecast misses, then reports the exceptions — stockout risks, expiry money, and 5 prioritized actions. An analyst, not an oracle: sanity-check quantities before ordering.

Simulators

Page	What it is for
What-if simulator	Play out a scenario — change demand or delay the next shipment — and see the effect on stockouts, write-offs, and spend.
Promo rescue simulator	Tests whether discounting near-expiry stock pays off: set how much faster a promo sells and the discount offered, and see write-off avoided versus margin given up.
Budget optimizer	Given a set purchasing budget, it chooses what to order first to prevent the most stockouts — urgent and high-value items lead.
Service-level simulator	Shows the trade-off between service level and cash: a higher target means fewer stockouts but more money parked in safety stock.
Campaign surge simulator	Model a campaign that spikes demand for a product line, and see which items would run out and how much to pre-buy.
Monte Carlo stockout risk	Rather than a single guess, it simulates each product's demand hundreds of times to give a probability of stocking out — accounting for how unpredictable each one is.
12-month projection	A 12-month forecast for one product: projected demand, a declining stock line showing when it runs out, and a confidence band around it.
Cash-flow timeline	Projects inventory cash over six months — restocking spend versus sales coming in — so you can see when cash is most tied up.
Bulk-buy trade-off	Checks whether a volume discount is worth it: weighs the savings against extra holding cost and the risk of stock expiring before it sells.
Remedy branch rebalancing	Suggests moving stock between Remedy's branches (BGC, Vertis North, Greenhills) to balance each site's share and use up near-expiry stock. Remedy is a sister company and a customer; this is based on what Healthspan has shipped to them.

Analytics

Page	What it is for
Data health	A completeness check on the data behind every forecast — SKUs missing a price, expiry, batch, or bin, negative stock, and items with too little sales history. Fixing these in the source sheet sharpens the whole app.
Monthly movement	Units received versus sold each month over the past year — the pulse of what's coming in and going out.
Inventory value	Where your inventory money sits, broken down by product line.
Deal scenarios	What the current stock is worth if everything sells à la carte versus through the bundle deals (2+1 up to 6+1, where the +1 is free). Prices are live from Shopify where connected (sheet price otherwise).
