1 • Getting started

HQ never uses the browser's own pop-up boxes any more. Every question, confirmation and message appears as an HQ dialog inside the app — Enter confirms, Escape cancels, and a form asks its questions in one box instead of one after another.

Sign in

1. Open hq.healthspan.ph in any browser (Safari, Chrome — phone, iPad, or computer).
2. Enter your Healthspan email and password. Tick Remember me on your own device; leave it unticked on shared computers.
3. Forgot your password? Ask an admin — they can set a new one in seconds. You can change it anytime from Settings (footer button; phone: Menu → Settings).

Install it as an app (do this once)

1. On iPhone/iPad: open hq.healthspan.ph in Safari → tap Share → Add to Home Screen.
2. On Android: open it in Chrome → menu : → Add to Home screen.
3. It now opens full-screen like a real app, with the Healthspan icon.
4. Make the bottom bar yours: Menu → ☆ Customize bar — pick the pages you use most for one-tap access. Home and Menu are always there (specialists also keep Log visit and New order fixed, with 2 free slots; everyone else picks 4).

Your favourites

1. Star any page from the ☆ in the top bar. It pins to the top of the sidebar, directly under Home, and to the top of your home page — one list, both places — and it follows your account, so the iPad, the phone and the laptop show the same favourites.
2. Prefer to set them all at once? **Choose favourites** — the edit link on the home row, or Menu → Choose favourites on a phone — opens the full picker. Up to **10**.
3. The Favourites heading in the sidebar collapses and expands like every other section, and remembers which way you left it.
4. They are yours, on this device, the same as the bottom bar — and only pages your role can open are ever offered.

Sorting any table

Click any column heading to sort A-Z; click it again for Z-A. It works on every table in HQ. Money, quantities, dates and expiry months sort by their real value, not alphabetically, and blank cells always go to the bottom. Section headings and TOTAL lines stay put. The sort lasts until the page redraws — it is a way to look at what is on screen, not a saved setting.

When a page refreshes

After you do something — add a line, submit a form, approve, release — the page updates in place. It does not blank out or jump back to the top; whatever you were looking at stays put while the new numbers land. You only see a "Loading" message when you open a page for the first time.

Attaching files

Where you see + Attach, you can add files straight from your phone or computer — photos, quotations, receipts, signed slips. They are stored in the Healthspan Google Drive, and opening one goes back through HQ, so your access here decides what you can see. Anything over about 4 MB opens in Drive instead. Remove a file with the × beside it.

1. On an account: the **Documents** panel on the profile page, so a clinic's own paperwork lives with the clinic.

2. On a visit: the recent-visits list under Log a visit. You attach to visits you logged yourself — a photo of the shelf, a signed slip — and can see, but not touch, files on anyone else's.
3. On an order: the order page, where the DR, the signed copy and the proof of delivery belong.
4. On a pull-out request: the register row underneath the form.
5. On any of the seven finance forms: the register row that appears once you submit — quotations, receipts, bank approvals, BIR forms.
6. A file can only be removed by whoever uploaded it (or by whoever runs that area). Removing it deletes it from Drive too, so the × asks first.

The bell

The bell at the top pings you when the system needs you — a red badge shows unread items. Tap it to see what happened and jump straight to the right page. It checks for news every 90 seconds. What pings whom is listed at the end of this manual.

Ask Healthspan

The Ask Healthspan button (top bar) answers plain-language questions over everything HQ knows — inventory, sales, receivables, cheques, approvals, backorders, quotes, pipeline — and its knowledge is automatically scoped to YOUR role: specialists get their own numbers, costs and margins only answer for finance and admin. Any hour, in the app or on Slack (/stock). A small dropdown in the drawer header lets you choose which model answers — Gemini Flash (default) or Claude Haiku — and remembers your pick on this device. It is also a full page — Home → Ask Healthspan, or  in the drawer — that keeps every conversation: your chats on the left (search, rename, delete), the thread on the right. Chats are yours alone; nobody else can open them. Settings → Shortcuts chooses which one the top-bar button opens.

Your manual & view-only pages

The manual link at the bottom of the sidebar (phone: Menu → My manual) opens this manual INSIDE the app — read it there, download it, or pop it full screen. And wherever a page is read-only for your role, a banner at the top says so and names who actually edits it; the same pages carry a small “VIEW” badge on your home screen.

You see the whole team's data everywhere a specialist sees only their own.

TIP — Every number view has a plain-language description at the top and a “how is this calculated” section — read those before asking. Most views also export to CSV.

Home, navigation & everyday mechanics

Home is the command center: live stat chips (orders today, pending, open follow-ups...), a needs-attention line, and big launcher cards for your role. It updates in place while the data syncs — no flicker, no reload.

The sidebar has two levels: a narrow rail of areas on the left — Home, Sales, Warehouse, Finance, Planning, Admin — and, beside it, the pages of the area you picked, under their usual section headings. Nothing moved out of reach: every page is still there, the rail only chooses which slice you see. Opening a page from a card, a favourite or a link switches the rail to its area for you. On a phone the Menu shows the same areas as a row of chips.

1. Search — the box above the sidebar list finds pages AND records. Type part of a page name, an order number (HS-1042 or the Shopify HG- number), an account, a specialist, a product (code or name), a quotation (QT-0007), a complaint, a pull-out or a finance request number (V-, RO-, PP-, RP-, RE-, CA-, ER-) and the hits appear grouped — every specialist's orders and accounts, as on the register. Cost pages are not part of the search for this role. Pick a result to open it:

orders, accounts and specialists open their own page, a product opens its detail panel, and a list record lands on its list with the row scrolled into view and flashed. ⌘K (Ctrl+K on Windows) puts the cursor in the box. On a phone the box is at the top of the Menu; a detail panel closes with ← in the top bar, its own ← Back / ✕, a left-edge swipe, or any bottom tab — none of them can leave you stuck on it.

2. Fast open: HQ paints from the copy saved on your device and refreshes quietly behind it, so a second visit is near-instant even on clinic wifi. **Sync now**, at the bottom of the sidebar under the Synced timestamp (Sync in the phone bar), forces a live read of the sheet when you need the number right now; otherwise the data refreshes itself every 15 minutes.

3. Every page has a real URL: bookmark an account, an order, a pick list; the browser back button works; share links with teammates — they'll see it with THEIR permissions.

4. Mobile: the bottom bar carries your essentials; the Menu button reaches every view by area, plus Settings, your manual and Sign out.

5. Themes: Healthspan (brand blue, light/dark/system) or Classic — Settings (footer button; phone: Menu → Settings).

6. Data freshness: the sheet syncs every 15 minutes; Shopify nightly at 2am; the footer shows the last sync. "Refresh" forces one.

Org chart — who reports to whom

Org chart (right under My profile in the sidebar) shows who reports to whom across Healthspan Global — names, titles and the reporting line, as the People team keeps it; colours mark co-founders, managers, leads, associates, part-timers and interns, and a dashed box is a vacant post. Tap any name to open the person's card: their title, who they report to, who reports to them, and the pages HQ has for them (a product specialist's sales page, for those who may open it). Find a name or title with the box above the chart; on a phone the chart is an indented list, and Tree / List switches the layout anywhere. It carries no pay and no costs — names and titles only. Until the HR module owns people records, the chart is updated with the app.

My profile — your own page

1. **My profile** sits right under Home in the sidebar; tapping your name in the footer or the phone menu opens it too.
2. It shows who you are signed in as, every finance form you have filed and where each one stands, your open follow-ups and this month's visits (if you carry a specialist tag, with a jump to your full sales page), any loaners you checked out, and the quick actions — password, manual, favourites.
3. On a phone or iPad, a small ← sits in the top bar whenever there is somewhere to go back to — and swiping right from the left edge of the screen does the same. At the bottom of the history it takes you Home.

Approvals — the control gate

Specialist orders that cross the account's credit limit (finance-set) or the company approval threshold (super-admin flag) save as HELD: invisible to the warehouse, waiting in Sales & CRM → Approvals.

1. Each row: account, amount, requester, and the exact trip reason with numbers (open balance + this order vs the limit).
2. Approve → order releases to the fulfillment queue; specialist and warehouse are pinged.
3. Reject → order is cancelled, reason on record; specialist is pinged.
4. Every decision is audited under your name. Decide fast — a held order is a waiting clinic.

Taking an order — the full mechanics

Order entry is where five checks run for you automatically. Open it from the Home card, the sidebar, or + New order on an account page (pre-fills the clinic).

The account line

1. Start typing; pick from the list. A “did you mean...?” guard catches near-duplicate spellings — pick the existing account, don’t create twins.
2. The moment an account is chosen you see its credit limit and open balance (if any). Promise deliveries with that line in view.

Adding products

1. Type/pick the product. Under the picker you immediately get the stock truth: X on hand · Y promised to pending orders · Z available to promise.
2. Pricing selector: À la carte, or any configured deal (5+1, 10+8...). Deals price per set and add the free line automatically.
3. Live promos apply themselves: if marketing has a promo running for that SKU, the discount or free units appear on their own, tagged with the promo name.
4. Qty is in sets when a deal is selected, units otherwise.
5. Free of charge tick = true samples/goodwill only (P0, counted as giveaways, never as deal units).

AVAILABLE TO PROMISE — ATP is a hard rule for specialists: you cannot add more units than Z. Managers and admins can override with a confirmation — the shortfall becomes a backorder problem they own.

Submitting — what happens in the background

1. The order gets an HS-number and lands in the register instantly.
2. Within credit limit and threshold → it goes straight to the warehouse queue (supply chain is pinged).
3. Over the account’s credit limit, or above the company approval threshold → the order saves but HOLDS: managers are pinged, nothing ships until they decide, and you’re pinged the moment they do. Rejected = cancelled with the reason on record.
4. Unusual orders (3× the account’s usual size, or lines >30% below list outside a deal/promo) are flagged to managers automatically — not blocked, just visible.
5. During the parallel run, also enter the order in Shopify — the banner reminds you until cutover.

Editing: any PENDING order can be edited (specialists: their own; you: anyone’s) — it reuses the order form, replaces the lines, recalculates balances, and audits the change. Fulfilled orders must be unfulfilled/reopened first.

The orders register & order pages

Every order ever — native HS orders plus the full migrated Shopify history (8,900+) — searchable, paginated (50/100/250 per page). You see everything.

1. Search & pages: the register is served page-by-page from the database — search by account, specialist, or order number (HS-1042 works); 50/100/250 per page.
2. Tap an order for its full page: lines, status, shipment panel (courier, waybill, dispatched/delivered), payment panel (paid, balance, terms), notes.

1. **Delivery cost** — next to the courier and waybill the shipment block takes what we paid the courier. It is an internal figure that never prints on the delivery receipt and is not shown to your role.

3. Statuses: pending → fulfilled, or cancelled. Held orders show an approval banner until decided.

4. Printables from the order page: FEFO pick list / packing slip, and the branded Delivery Receipt with VAT split, the clinic's delivery notes, and signature blocks.

Manager extras: edit anyone's pending order; fulfill from pick-confirm; you cannot delete or record payments — those are admin/finance.

Quotations

Formal, numbered paper for clinics that decide by document. Quotes use the exact same pricing engine as orders — catalog prices, deals, live promos — so an accepted quote converts without a single number changing.

Creating and sending

1. Sales & CRM → Quotations → + New quotation.
2. Account, items (same picker and pricing selector as orders), validity date — defaults to 30 days.
3. Save → it gets a QT-number. Print produces the branded A4 with VAT split and validity date.
4. Mark it sent when it goes to the clinic. Expired open quotes get flagged automatically.

Closing the loop

1. Clinic says yes → mark accepted → → order: the order form opens prefilled; review and submit — credit, ATP, and approval checks all run as normal.
2. Clinic says no → lost with a reason (price / competitor / timing / no response). Honest reasons make the win-rate number mean something.
3. Pipeline syncs itself: accepting a quote marks the account's open opportunities WON and moves its stage to active; a lost quote records the loss and reason on the opportunity — the funnel maintains itself.
4. The view header shows open quote value, accepted count, and win rate for the whole team.

Visits, follow-ups & the automatic to-do list

Logging a visit (~10 seconds)

1. Log visit → account → visit type → outcome → optional note → save. Add which products you endorsed — they show on the account's timeline.
2. Pick a FUTURE date to create a planned visit instead — it appears on the calendar and in the queue below.
3. A duplicate-name guard protects here too — always pick the existing account.
4. Attach as you go: each visit you logged carries + Attach in the list below the form, so a photo or a signed slip stays with the visit it belongs to.

Follow-ups & plans — the queue

One list of everything owed: follow-ups born from visit outcomes (“Follow-up needed”), planned visits, and the tasks the system creates by itself. Overdue items flag red. Tick ✓ done / ✓ visited as you go.

What the machine adds on its own (nightly)

1. Post-delivery follow-up: ~2 weeks after an order is fulfilled, a follow-up task appears for the account’s owner.
2. Welcome call: a brand-new account’s first order creates an onboarding task the next morning.
3. Both also ring the bell. They’re deduplicated — the same order never nags twice.
4. Monday digest: every Monday the bell brings your week in one ping — booked ₱, orders, visits, open follow-ups.

Managers see the whole team’s queue; specialists see their own.

Reorder due, pipeline & events

Reorder due

1. The system computes each clinic’s median reorder cycle from its real history.
2. Accounts 25%+ past their cycle appear here — routed to each owner; you see everyone.
3. One tap: log the visit or start the order. Going-quiet alerts follow the account’s TIER: A = 30 days, B = 45, C = 60 — an important clinic gets flagged three times sooner.
4. Your 3 best calls: Monday mornings the bell brings each specialist their three highest-value accounts drifting past their rhythm — ranked by six-month value × how overdue.

Pipeline & opportunities

1. Stages: lead → contacted → qualified → active, seeded from real behavior; every move is audited; losses need a reason.
2. Opportunities: estimated value + expected close date per card; the header shows weighted pipeline (25/50/75/85%) and win rate.
3. Prospects convert with one tap from the Prospects tab.

Events calendar

One month grid merging campaigns, planned visits, and demo/training days across the team. The weekly Calendar of Events, live.

Accounts (CRM) — one memory per clinic

One row per customer, merged across the OUT sheet, Shopify, and the visit log. Tap any row for the full profile page.

The account page

1. KPI cards (booked, shipped, momentum, visits) · health score 0–100 with its reasons · merged clickable timeline (orders open) · what-they-buy · “worth offering next” upsell panel mined from co-purchase history.
2. Details (Edit): contact person, phone, email/Viber, address, region & city, clinic type, specialty, tier A/B/C, source, delivery notes (these print on the DR), doctor’s birthday & clinic anniversary, LTO/PRC licenses with red/amber expiry pills, notes.
3. Contacts: doctor / purchaser / nurse with phone, email, Viber — add or remove inline.

4. Credit line: limit and open balance, right where you quote from.
5. Quick actions: + New order · + Log visit · Call / Viber quick-log (a phone touch counts like a visit — timeline, coverage, and the going-quiet alert all see it) · Statement.
6. Documents: quotations, signed DRs, clinic paperwork — attached to the account itself, so they are still there when the next person opens it.

Keeping it clean (manager/admin powers)

1. Merge duplicates: open the WRONG account → → Merge into... → type the real one → confirm. Reversible (unmerge links on the target). Check both pages side-by-side first.
2. Parent / child: open the child → △ Set parent... — child keeps its page, rolls into the parent's totals and branch chips. "X - Branch" names group automatically.
3. Ownership: assign the owning specialist from the page or inline in the list — reorder-due, dormancy alerts, and auto-tasks route to the owner.
4. Prospects engine: 500+ Shopify-only names split into likely mismatches (≈ suggestion + one-click merge), active prospects, and lapsed buyers. Export CSV to hand out call sheets.

Tabs

All accounts · Prospects · Growing / Declining / Dormant (momentum screens) · Vs Shopify (booked vs shipped reconciliation).

Targets, scorecards & the roster

1. Set targets: monthly ₱ per specialist, in-app (copy-from-last-month). Overrides sheet/corporate numbers everywhere instantly. Audited.
2. Roster: add a new PS or deactivate one — deactivated specialists vanish from pickers and targets; history stays.
3. Monday team digest: the bell brings the team's week — booked, orders, visits — every Monday morning; each specialist gets their own version.
4. Review scorecards (mgmt-only, DB-enforced): quarterly per-specialist reviews auto-filled from live data — booked vs target, trend vs prior quarter, visits, accounts touched, ₱/visit — plus your 1-5 rating and private comments. Printable for the review meeting. Specialists can never read them.

Sales analytics — the scoreboard

1. Sales overview: units and value for any period (today → 12 months → custom), split deals vs à-la-carte vs true giveaways, charts included.
2. Sales vs target: monthly attainment by total, brand line, product, and specialist — the 245-row corporate target file, or in-app targets when set.
3. Per-specialist drill-downs and profile pages with month calendars.
4. Field coverage: contacts/day, accounts reached vs the whole universe, not-reached ranked by value.
5. Vs accounting: continuous peso-for-peso reconciliation to the official Sales Report.
6. Leaderboard & pace: MTD race + projected month-end attainment per specialist — the mid-month coaching tool.

Baked-in conventions: deal +1s are deal units (not free); "free" = ₱0 outside any deal; pull-outs and TEST never count as sales; native orders fold into sales totals only at cutover (no double counting).

With or without Remedy

1. Remedy is a sister company and one of our customers, and Healthspan also sells to its own staff and academy. Accounting's Sales Booked leaves both out.
2. So every sales view opens on **External only** — third-party sales, the same population accounting counts. The toolbar switch flips the whole page to **Incl. Remedy** when you want the full picture.
3. It is one setting across all the sales views, the booked chip on your home page and the Accounts list, so those pages can never show you two different answers. Every figure is labelled with which population it is.
4. The setting is yours, on this device, like the period and product-line filters.
5. On the Accounts list, External only subtracts each clinic's internal orders rather than hiding the clinic — only an account whose every order was internal drops off the list. So a real clinic that once had an order mis-tagged still shows, minus that order.

TARGETS AND COMMISSIONS — Targets and commissions are the exception: they always count external sales only, whatever the toggle says. A target is set on third-party sales and commission is paid on them, so Remedy and internal orders never move either number.

CRM activity — visits & calls per specialist

1. Sales analytics → **CRM activity**: the field effort itself, per specialist — visits, calls, demos, accounts touched, active days, and how often a contact ends in an order, with a 13-week trend.
2. Calls are the call / follow-up / Viber quick-log visit types; everything else counts as a field visit. Planned visits count once they are done.
3. It reads the in-app visit log, so it is only as good as the logging discipline — activity is the input, the Sales views measure the output.

Business review — the monthly report, generated

1. Sales analytics → **Business review**: the monthly sales performance report computed from HQ — at a glance, brands vs target with a 13-month chart, products per brand, machines and demo units, accounts monitoring, clients & buying behaviour, one panel per specialist, then the plan. Pick the month at the top; figures are external sales only, as on Targets.
2. **What HQ noticed** is written by the page from the figures — pace against target, brands ahead and behind, first orders, repeat accounts going quiet, specialists on and off pace, activity that has not turned into orders. It re-reads the same way every time; the story behind the numbers goes in the commentary boxes.
3. The commentary boxes are the only thing typed: Key wins, Key challenges, Territory updates, Plan of action, Sales programs & promos and Sales plan notes are the sales manager's; each specialist has their own box under their panel. Every box shows what the previous report said and whether it changed. **Draft with AI** writes a first draft from the report's own figures — edit, then **Save**.
4. **Save snapshot** freezes the figures and the commentary as they stand. The next time the page opens it says what moved since — revenue, attainment, orders, accounts, per brand and per specialist — within the same month; across months it compares the commentary only. Unsaved typing is saved before the snapshot is taken.
2. Two snapshots now take themselves: the **mid-month checkpoint** on or after the 15th and the **month-end checkpoint** for the month that just closed — frozen the first time a manager or admin opens HQ on those days (the bell reminds you). "Since last report" therefore never depends on someone remembering the button; Save snapshot is still there for any extra point you want to mark.

5. **Export PowerPoint** builds the whole deck in the browser: cover, at a glance, what moved, two-column commentary slides (this report / last report), brand and product slides with real charts, machines, accounts, clients, specialists — one performance slide and one commentary slide each — plan, next month's targets, thank-you with the presenter list. Everything stays editable in PowerPoint.
6. Windows: revenue and targets reach back 13 months; orders, accounts and buying behaviour as far as the order index (about six months — older months blank those sections and say so); the visit log 120 days. In the first three days of a month nothing is projected.
7. Names on the review come from each person's HQ account, and the review groups by the Team set on the account. Revenue under a Shopify tag that is not an account (a territory, "Vacant") is flagged with its amount — ask for those orders to be re-tagged.
8. The team deck carries no individual slides any more — each specialist presents from their own deck. Sales analytics → **Reports** lists every deck for the month with an **Inputs** column (boxes in, missing on hover, last edited), **PowerPoint / PDF** per row and **Download all**. Everything is built from live figures when you click.
9. **Copy for Notion** on the Reports page puts this week's Sales block (brands vs target, machines, accounts, activity, specialists, what HQ noticed) on the clipboard as Notion-ready text — paste it under Weekly Report/Updates in the Healthspan Weekly Meeting page.
10. **Google Slides** on the Reports page uploads a deck to the shared Drive folder, converts it to Slides and shares it with the addresses you type (you are always included) — the team edits it there. The team deck now also carries a monthly slide per brand, an Accounts overview (active, new, new-to-brand), SkinPen to date and the Mixexpert → Mesoesthetic tracker; paste the Mixexpert clinic list once on the Business review and HQ counts conversions.
11. **Settings** (footer or phone menu) holds theme and light/dark mode, Change password, Sign out, favourites, the bottom bar and your manual. Settings → AI holds the company default model (Gemini Flash or Claude Haiku) for Draft with AI and the planning review and lets you test the connection; Ask Healthspan has its own dropdown.

BEFORE THE MEETING — open the month, read What HQ noticed, fill the six boxes (or Draft with AI and edit), check each specialist has written theirs, Save snapshot, Export PowerPoint. The deck is the page.

Saved reports — your own reports, on a schedule

Sales analytics → **Saved reports** is the report builder: pick a source, tick the columns you want, add filters, group and total, sort by clicking a header, and save it under a name. Run it whenever, export the CSV, or put it on a schedule and let HQ run it for you.

Building one

1. **+ New report**, name it, choose a **source**. Yours are: stock on hand, batches & expiry, sales lines, HQ orders and order lines, accounts, visits, quotations, equipment serials and loaners.
2. Tick the **columns** (none ticked = the first eight). Add **filters** — text (equals, contains, in a list), numbers (greater / less than), dates (on, after, before, last N days, this month, last month, this year). All filters must match.
3. **Group by** a column to get one row per value with a count and any totals you add (sum, average, min, max of a number column). Click a header in the preview to sort; the row cap keeps very large results sane.
4. The **preview** updates as you build (first 200 rows on screen; the export has everything). **Save**, then **Export CSV** opens in Excel or Sheets.

Scheduling and sharing

1. Set the schedule to **every day, every week** (pick the weekday) **or every month** (pick the day, or the last day). At **6am Manila** the server runs the report as you and files the CSV under **Runs on the server**; the bell tells you it is ready. Nothing is e-mailed — the file stays inside HQ.
2. **Run on the server now** proves a schedule before waiting for the morning. Each run keeps its own CSV, so last week's numbers stay downloadable next to this week's.
3. Tick **Shared** to let everyone who may read that source open the report; they can run and export it, only you (or an admin) can change or delete it.

THE SAME RULES AS EVERY PAGE — a specialist who opens a shared report sees only their own rows; cost figures appear only for the roles that see costs elsewhere, in the preview and in the scheduled file alike. A schedule can never show more than the person who saved it could see.

Fulfillment — queue to doorstep

1. Fulfillment queue: every APPROVED pending order, oldest first, age-flagged. Held orders never appear — queue = cleared to ship.
2. Pick list (from the order): exact batch and bin per line, earliest expiry first (FEFO). Printable; doubles as packing slip.
3. Scan to pick: camera scan every unit against the order — wrong item red-stops, over-scan warns, progress bar per line, per-line “fill” fallback. All green → one tap writes the ledger AND fulfills the order; the specialist is pinged.
4. Confirm picked on the pick list does the same from the paper flow (offers to mark fulfilled in the same motion).
5. Delivery receipt: branded, VAT 12% split (net = ÷1.12), clinic delivery notes, signature blocks — and a permanent BIR-friendly DR number from the company series, assigned automatically the first time the DR is printed (the order keeps it forever). Record courier + waybill; mark dispatched / delivered.
6. Fulfilling or cancelling an order releases its ATP promise automatically.

You hold this whole chain for oversight/unblocking; raw Scan (receive/count) and the ledger stay with supply chain.

Serials, loaners & waves

Serial numbers — equipment, unit by unit

1. Logistics → **Serial numbers**: one row per physical equipment unit — lasers, devices, handpieces. Add them at receiving (paste several serials at once, one per line, with the batch if there is one).
2. Each unit is in stock, on loan, sold or disposed. Consumables stay batch-tracked — serials are for the units where **which exact machine** matters.
3. Mark a unit sold with its order or DR reference and the clinic that has it now; disposal asks for confirmation. Every change lands in the activity log.
1. **Warranty**: every unit carries a warranty end date (📅 in the Warranty column, or edit in its history panel). Green while it holds, amber inside 60 days, red once lapsed; the **Warranty due** tab lists the units to act on. The warehouse is pinged 30 days before a warranty lapses and again when it has.
1. **Service & repair history: history** on any row opens the unit's panel — where it is (warehouse, clinic on loan, sold to), its warranty, and every service, repair, calibration or inspection logged against it with the vendor, what was done and the next due date (service

costs are a finance matter and are not shown on your side). Log a new event from the same panel; a “next due” date pings the warehouse when it arrives.

Demo / loaner units

1. Logistics → **Demo / loaners**: check a serialized unit out to a clinic with a due-back date and the condition it left in. It gets an LN- number and drops out of available stock immediately, so nobody can lend or sell the same machine twice.
2. The register shows everything out, worst due date first. A loan past its due-back date turns red — and pings whoever checked it out, nightly, once per loan.
3. Return: note the condition it came back in; the serial goes back to stock. A demo that closes: → **sale** records the order reference and marks the serial sold.

Wave picking — several orders, one walk

1. In the **Fulfillment queue**, tick two or more pending orders and hit **Release wave**. The wave gets a WV- number.
2. One combined pick list: lines merged per SKU, sorted by bin, FEFO batches suggested — one walk of the warehouse instead of one list per order. The per-order split prints under each product.
3. Pull the total per SKU, sort into orders at the packing bench, then confirm each order individually — the queue and the ledger behave exactly as if each was picked alone.

Backorders — shortfalls with a life of their own

1. When a manager overrides the available-to-promise limit at order entry, the shortfall is recorded as a backorder automatically (order, SKU, units short).
2. Open backorders show at the top of the Fulfillment queue with their age.
3. Auto-release: the moment a PO receive covers the shortfall, the backorder releases itself — the warehouse and the order’s specialist are both pinged that the order can now ship.
4. Cancel a backorder manually if the underlying order was cancelled.

Short-dated stock — working the shelf-life clock

Logistics → Short-dated stock. The expiry tracker tells you WHAT is running out of shelf life. This page is what we are DOING about it — every lot with units on hand expiring within six months, worst first, with the peso value at risk beside it.

1. Each lot gets a plan: discount or promo it, give it as FOC to a loyal account, transfer it to a Remedy branch, quarantine it as unsellable, or accept the write-off. Choosing “quarantine” offers to pull the units out of sellable stock immediately.
2. A plan carries an owner (who is actually doing it), a target date, and a note — which account, what discount.
3. Lots with no plan yet are flagged amber and totalled separately: that number is money nobody has decided about.
4. Done closes the lot with an outcome note, so the queue becomes a record of what was recovered and what was lost.
5. Discounts and giveaways still go through the normal promotion and order flow — this is the worklist, not a separate discount channel.

Pull-out requests — stock for internal use

Logistics → Pull-out requests. Anything leaving the warehouse that is not a sale — KOL engagements, brand campaigns, FOC promos, trade partnerships, launches and training — goes through here. It replaces the Google pull-out form, and unlike the form it actually holds the stock.

1. File a request (anyone with a login): pick the products from the catalogue — you see on-hand and available-to-promise beside each one — then quantity and unit, the fund source (the QBO class that pays for it), the reason, the product line, the date needed, and what it is for.
2. Submitting reserves the units immediately. They drop out of available-to-promise, so nobody can sell the same box while your request is pending. If there is not enough available you are warned but can still submit — the warehouse sees the shortfall.
3. The fund source approves. Only the person mapped to that class (or their named backup) can decide, and they are pinged the moment it lands. Approval notifies finance and the warehouse; a rejection comes back to you with the reason and frees the stock.
4. If you are an approver, the page opens with a banner naming the classes you own and what is waiting on you. Your approval rights come from the fund-source list, not from your access level — several approvers hold view-only access everywhere else in HQ and still approve their class normally.
5. The warehouse releases the goods — and that is the only step that moves stock: earliest-expiry-first, batch-stamped against the PL number, so a pulled lot is as traceable as a sold one.
6. Mark booked: during the parallel run the specialist still records it in Shopify; tick it here with the reference so nothing is left half-done.
7. Pull-outs are internal issues — they never count as sales, anywhere.

Finance forms

Seven forms live under Finance forms: pull-out requests, voucher for approval, request to order/pay, proof of payment, request for replenishment, expense reimbursement, and request for cash advance. They replace the Google forms and behave the same way as each other.

1. Anyone with a login can file one. Fill it in and **add the supporting documents before you submit** — the form has an Add file / Add receipt control that takes photos straight from a phone camera, or PDFs. They upload the moment the request is filed; you can still add more from the row in the register afterwards.
2. **Expense reimbursement** and **Expense report (revolving fund)** will not submit without at least one receipt — finance cannot process a line without one, so the form does not let it leave without one either.
2. Some sections appear only when they apply. Choosing “Pay” on a request to order/pay shows the supplier and bank fields; choosing “Order” shows the item rows instead. Only what you can see is submitted.
3. It then moves through approval steps set for that form. The register shows which step each request is on and who it is waiting for. You are told when yours is approved or rejected, and rejection always comes with the reason.
4. Nobody approves their own request — if you are the approver for a class and you file against it yourself, it goes to someone else.
5. You can cancel your own request while it is still pending, and nothing else about it.
6. Each form has its own number — V- for vouchers, RO- for requests to order/pay, PP- proofs of payment, RP- replenishments, RE- reimbursements, CA- cash advances, PL- pull-outs.

Who sees what: these carry bank details and personal claims, so the register is not open to everyone. You see your own requests, any waiting on your decision, and finance and admin see all of them. Attachments follow the same rule.

Expense reports — liquidating a revolving fund

1. For whoever holds a revolving fund. **Finance forms → Expense report**: the period covered, then one line per receipt — date, category, description, amount. The total must equal the lines, and every receipt attaches to the register row.
2. It gets an ER- number and moves through the approval steps set for this form, like every finance form. Approval clears the way to top the fund back up — that stays its own filing, the Request for replenishment.

Period close — what freezes when a month is signed off

Once accounting has signed a month off, the super admin closes it on the Cutover switches page. From then on, everything dated on or before the cut-off is frozen: order amounts, order dates, order lines, credit memos, cheque maturities and that month's targets.

1. What still works inside a closed month: recording a payment (a July invoice paid in September is September cash), marking shipments dispatched or delivered, picking and fulfilling, and assigning a DR number. Those are operational, not revenue-changing.
2. What is refused: changing an order's amount, date or lines; cancelling, trashing or restoring it; back-dating an open order into the closed month; deleting a cheque; editing a closed month's target. If a closed sale needs reversing, record a credit memo — which is the accounting-correct move anyway.
3. Why you cannot work around it: the rule lives in the database, not the screen. The app warns you first as a courtesy, but even a faulty page or a background job cannot rewrite a closed month.
4. Reopening is the same control and only the super admin has it — it warns exactly what is being unlocked.

Campaigns & the promotions engine

Campaign calendar

1. Each campaign: name, window, expected uplift, SKUs. It is a demand signal: the stockout forecast banners it and the AI review weighs it.
2. On start day the field team is pinged automatically.

Promotions engine (read)

1. Name (shows on order lines) · start/end window · eligible SKUs (comma list, or * for all).
2. Mechanic: Buy N get M free (free units auto-added) or % off (unit price discounted).
3. While LIVE it applies automatically in order entry AND quotations, every line tagged with the promo name — measurable in Sales overview.
4. Turn off / delete anytime; past orders keep their tagged lines.

The inventory command center

1. Dashboard: KPI cards, running-out-in-30-days, category split, out-of-stock commercial, expiring-in-3-months.
2. Action center: everything needing action today, prioritized — the daily to-do.
3. All SKUs: sortable master list; tap for the product drawer (batches, 13-month trend, deals, forecast).
4. Alerts: out of stock · low stock · negative stock · expiry tracker · reorder alerts — each with exact SKUs and quantities.
5. Planning: stockout forecast (trend + seasonal velocity) · stock coverage · reorder plan · reorder point · demand variability (CV classes) · ABC analysis · write-off forecast.
6. Batch view: every batch with expiry and bin, FEFO-ordered — the same data behind pick lists and recall.
7. Data health: feed freshness, price≠Shopify and stock≠Shopify reconciliation — the system tells you when to distrust its own feed.

Finance views: aged inventory · shrinkage tracker · cash in expiring stock — inventory as money.

Logistics views: Remedy branch shipments log · branch expiry watch.

Every view: plain-language description, “how is this calculated”, CSV export, full peso figures.

The ten simulators

Simulator	What it answers
What-if	Change price/velocity/lead time on one SKU — see stockout and cash effects
Promo rescue	Can a promo clear at-risk stock before it expires, and at what discount?
Budget optimizer	Best allocation of a fixed buying budget across SKUs
Service level	Safety stock needed for a chosen fill rate
Campaign surge	What a campaign’s uplift does to stock coverage
Monte Carlo stockout risk	Thousands of demand scenarios → probability of stockout per SKU
12-month projection	Stock trajectory a year out under current velocity
Cash-flow timeline	What the buying plan does to cash, month by month
Bulk-buy trade-off	Volume discount vs holding/expiry risk
Branch rebalancing	Which Remedy branch stock should move where

Each is one click, live data, with its method explained under the result.

Forecasting & the AI layer

1. Stockout forecast: trend + seasonal velocity per SKU; campaign windows banner it so promos stop being surprises.
2. Forecast accuracy (MAPE): each month’s forecast is frozen automatically, then scored against actual movement — MAPE and bias per month, worst misses ranked. The forecast grades itself.
3. AI planning review: one click walks every SKU, campaigns, and recent misses → an exception report with 5 prioritized actions and quantities.
4. Ask Healthspan: plain-language questions over live inventory, sales by week and month, accounts, targets and specialists, in-app or Slack (/stock), any hour.

What is deliberately not yours

Raw scan/ledger writes (supply chain) · PO/PDC/item-master edits (read-only) · commissions (finance/admin) · payments (finance) · costs & margins wherever they appear — the valuation page, PO unit costs, and the supplier scorecard (finance/admin/warehouse) · the Activity log (admin only) · user management (admin; IT for specialist accounts) · cutover (super admin). Your sidebar only ever shows pages you can open.

When the bell pings you

The bell pings only the person who ACTS — nobody is copied on someone else's action items. The queues themselves are always open in-app for anyone with access.

You get pinged when...	What to do	Where it takes you
An order is HELD for approval	Decide — approve or reject	Approvals
An anomaly is flagged (3× size / deep discount)	Sanity-check with the specialist	Orders
A campaign / promo goes live	Brief the team's pitch	Campaigns
A quote you own has waited a week	Chase it or close it out	Quotations

Something looks wrong? Check Data health first (feed freshness and reconciliation), then tell the super admin. The app ships improvements weekly — if a step in this manual moved, it moved somewhere better.

Receiving — inbound shipments, counts, terms, landed cost

Logistics → **Receiving** is the page for everything coming in from a supplier. A purchase order says what we ordered; a **shipment** is what the supplier actually sent — one PO can arrive in several. Each shipment carries its papers and tracking (supplier invoice or packing list no., carrier, tracking / AWB / BL, ETD, ETA, customs status, broker) and walks a pipeline: expected → on the water → in customs → arrived → counting → received → closed. A shipment past its ETA pings the warehouse nightly.

Reading a shipment

1. You can open every shipment: status, tracking, the count at the door versus the PO, and whether it has been posted to stock. Cost columns (invoice, FX, landed cost, terms) are not shown to your role.
2. Shipments are created, counted and posted by the warehouse; finance fills the money fields. Short or over counts turn into supplier claims on the complaints log.

WHY A SEPARATE PAGE — receiving used to be a button on the PO line. A shipment is its own record now, so the papers, the tracking, the count, the claim, the due date and the landed cost all hang off the thing that actually arrived — and one PO can arrive in three boxes across two months without losing track of any of it.

Your pages — the complete directory

Every page this manual's role can open in HQ, in sidebar order, with what each one is for. If a page is not listed here, your role does not have it. Where a page shows a view-only banner, the editing role is named on the page itself.

Home

Page	What it is for
My profile	Your own page — who you are signed in as, the finance forms you have filed and where each one stands, your open follow-ups, loaners you checked out, and the quick actions (password, manual, favourites) without digging through menus.
Org chart	Who reports to whom across Healthspan Global — names, titles and the reporting line, as the People team keeps it. Tap a name for the person's card and their pages in HQ.
Ask Healthspan	Ask Healthspan as a full page: your saved chats on the left, the conversation on the right. Same brain as the side chat — stock, sales, accounts, targets, in plain language.

Sales & CRM

Page	What it is for
New order	Take an order: searchable account and product pickers, deal pricing (the +1 lines add themselves), FOC lines, credit and approval checks, an HS number on submit.
Orders	The register of every HQ order — status, amount, paid and balance, shipment marks — with a full page per order.
Log a visit	For the product specialists, from the iPad: log every doctor/clinic visit in ~10 seconds — even when there's no order. Pick your name once and it's remembered.
Follow-ups & planned visits	The team's to-do list, generated by the visit log: every visit whose outcome was Follow-up needed stays here until ticked done, and every visit logged with a future date shows as a planned visit (overdue ones flagged). Specialists see their own; managers and admins see everyone's.
Accounts (CRM)	Who Healthspan sells to — accounts ranked by value, order cadence, and whether they're growing, declining, or dormant. Also shows how concentrated you are on Remedy.
Set targets	Set each product specialist's monthly peso target (admins & sales managers). Values saved here override the sheet/corporate numbers for that specialist and month across the whole app — Vs target, the Specialists view, and each specialist's own page.

Sales analytics

Page	What it is for
Sales overview	Use External only / Incl. Remedy in the toolbar to switch the whole page between third-party sales and everything.

Sales vs target	External sales only — Remedy and Healthspan-internal orders never count toward a target. Actual booked sales versus the monthly targets set in the sheet's Targets tab — total, per line, and per product.
Sales per specialist	Each product specialist's booked sales — revenue and units — over an adjustable period, and against their monthly target if one is set. Specialists are read from the order's first tag in Shopify (e.
Leaderboard & pace	The month-to-date race and the finish-line projection. Pace = what you've booked ÷ how much of the month has passed, against your target — green means on pace for 100%.
Reorder due	Accounts past their usual buying rhythm. The cycle is learned from each account's own order history (median gap between orders, 3+ orders needed).
Pipeline	The funnel, staged: lead → contacted → qualified → active. Stages start from real behavior and every manual move is audited.
Events calendar	One calendar for the room: campaigns, demos, trainings, and planned visits in a single month grid — Mench's weekly Calendar of Events, live. Specialists see their own visits; everyone sees campaigns.
Quotations	Formal quotations for clinics: build a quote with the same pricing as an order, print it, mark it sent/accepted/lost, and convert an accepted quote to an order in one tap. Win rate is tracked from outcomes.
Approvals	The sign-off queue: specialist orders that trip a credit limit or the big-order threshold are held here — approve to release them to fulfillment, reject to cancel with the reason on record. Credit limits are set by finance on account pages; the threshold is a super-admin setting on this page.
Deals vs à la carte	Do the bundles outsell single-unit pricing? Per product: units and revenue moved through deals versus à la carte, the effective per-unit price inside a deal (revenue ÷ all units including the +1), and the effective discount versus the à-la-carte price.
Free items	Items given away at ₱0 outside any deal — samples, marketing, goodwill — kept separate from sales. Deal +1s are not here; they count as deal units.
CRM activity	The field effort itself, per specialist: visits, calls, demos, accounts touched, and how often a contact ends in an order — from the in-app visit log. Sales activity is the input; the Sales views measure the output.
Field coverage	Veeva-style field activity per specialist, built from bookings: how many accounts each specialist reached in the period vs their own account universe (≈6 months), orders per active day, samples given, and — most useful — the accounts not reached list, sorted by value, as a ready follow-up sheet. A booking counts as contact; visits without an order would need a call log (phase 2).
Vs accounting	Peso-for-peso check against the official 2026 Healthspan Sales Report (accounting's Google Sheet, read live at every sync). Accounting's Sales Booked excludes Remedy, so the dashboard applies the same rule: external = all booked orders minus Remedy/Healthspan-internal tags.
Review scorecards	Quarterly performance reviews, filled from the numbers instead of memory: booked vs target, trend vs the previous quarter, visits, accounts touched, and peso-per-visit efficiency — plus a rating and comments per specialist that save per quarter. Print all for the review meeting.

Business review	The monthly sales performance report, built from HQ instead of typed into slides: brands, products, machines, accounts, buying behaviour and each specialist, with what HQ noticed in the numbers. People add only the commentary — the sales manager owns the wins / challenges / plan boxes, each specialist owns their own — and every box shows what it said last time.
Reports	Every review deck for the month, built from live figures the moment you click: the team deck for the sales manager, one deck per specialist, PowerPoint or PDF. The Inputs column says whose commentary is in before anyone downloads.
Saved reports	Your own reports, the way NetSuite people mean it: pick a source (stock, batches, sales lines, HQ orders, accounts, visits, quotes, payments, POs, finance forms, serials, loaners), tick columns, add filters, group and total, sort — and save it. Run it any time, export the CSV, or schedule it daily / weekly / monthly: at 6am Manila the server runs it as you and drops the CSV in HQ with a bell notification.

Logistics

Page	What it is for
Fulfillment queue	Verna's daily worklist: every pending order, oldest first, with age flags (red past a week). Tap an order to fulfill or cancel it, or print the Pick list — a FEFO pull sheet that names the exact batch and bin for every line, doubling as the packing slip / delivery receipt.
Remedy branch shipments	A log of product Healthspan has shipped to Remedy's clinic branches — BGC, Vertis North, Greenhills — from 2025 onward. Remedy is a sister company and a customer.
Remedy branch expiry watch	For each Remedy branch, the stock Healthspan shipped there sorted by expiry — so each clinic can see what to use up first.
Cycle counts	Cycle counts: pick a scope, count physically (blind — expected quantities are hidden), and the session grades itself against the stock truth. Two matching counts in a row are the evidence that lets the ledger replace the sheet.
Quarantine & disposal	The compliance trail for stock that can't be sold: expiring, damaged, QA-hold, and doubtful returned units sit here, out of sellable stock and ATP, until someone inspects them — release puts them back in the ledger, dispose closes the record with who and when.
Short-dated stock	The worklist for stock that is running out of shelf life: every batch with units on hand expiring within six months, worst first, with the peso value at risk. Each lot gets a plan — discount it, give it as FOC to a loyal account, transfer it to a Remedy branch, quarantine it, or accept the write-off — an owner, and a target date, so expiring money is worked instead of watched.
Warehouse KPIs	The warehouse scoreboard: order cycle time (taken → fulfilled), share fulfilled within 48 hours, fill rate (orders that never hit a backorder), the open queue, and units picked this week.
Purchase orders	Purchase orders and receiving. Draft the PO, add lines, mark it ordered; when stock arrives, receive per line — batch and expiry captured at the door, written straight into the stock ledger.

Receiving	Inbound shipments from suppliers, one record per delivery against a PO: carrier, tracking, ETD/ETA, customs, broker; the count at the door per line (batch, expiry, bin, QA hold) that writes the stock ledger and the PO; the supplier's terms turned into a payment due date; and the landed-cost calculator — invoice × FX plus freight, insurance, duty, VAT (recoverable by default), brokerage, arrastre, storage, trucking, bank charges — allocated to a real ₱ cost per unit and applied to the PO for valuation. Short or over counts raise a claim with the supplier in one tap.
Suppliers & imports	The supplier master: currencies, payment terms, lead times, contacts — plus every PO on the water with its ETD, ETA, and customs status in one list.
Transfer orders	Remedy branch shipments as proper documents: draft the lines, dispatch (each line leaves the ledger as a FEFO batch-stamped movement, ref TR-n), mark delivered. In-transit units are visible instead of living in chat threads.
Serial numbers	One row per physical equipment unit — lasers, devices, handpieces — tracked by serial number from receiving through loan, sale or disposal. Consumables stay batch-tracked; serials are for the units where which exact machine matters.
Demo / loaner units	Demo and loaner equipment out with clinics: who has which serial, since when, due back when. Overdue loans ping whoever checked the unit out.
Batch recall trace	The one-bad-day feature: enter a SKU and/or batch number and get every clinic that ever received it — dates, quantities, order refs — as a printable contact list. Sources: every OUT-sheet shipment row plus the platform ledger.
Complaints log	Product quality reports with the batch on record — one tap into the recall trace shows every other clinic that received the same lot. Closing a complaint requires a resolution note; the log is the compliance record.

Finance forms

Page	What it is for
Pull-out requests	Inventory pull-outs — stock leaving the warehouse for internal use (KOL engagements, campaigns, FOC promos, trade partnerships, launches and training) charged to a department's fund source. Anyone can file a request; the fund source named on it approves.
Voucher for approval	Voucher for approval — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request to order / pay	Request to order / pay — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Proof of payment	Proof of payment — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request for replenishment	Request for replenishment — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Expense report (revolving fund)	Expense report — the liquidation of a revolving fund. Whoever holds a fund itemises every peso spent in the period, receipt by receipt, and it routes to the approver set for this form (Admin → Approval routes).

Expense reimbursement	Expense reimbursement — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.
Request for cash advance	Request for cash advance — one of the finance forms. Anyone signed in can file one; it then moves through the approval steps set for that form (Admin → Approval routes), and every decision is recorded with who and when.

Finance

Page	What it is for
AR aging — receivables	Who owes what, and for how long: every unpaid balance bucketed into current / 31-60 / 61-90 / 90+ days, per account. Ages count from the order date plus any terms noted on the order (e.
PDC register	Every post-dated cheque, tracked to maturity: who issued it, which bank, how much, and when it can be deposited. Highlighted rows are due — deposit them.
Cash-flow forecast	Expected collections, week by week: receivables land in the week their payment terms mature, post-dated cheques in the week they can be deposited. Overdue money gets its own bucket.
Returns & credit memos	Returns and credit memos with permanent CM numbers. Record what came back, whether it restocks or gets written off, and print the CM for accounting.
Aged inventory	Products that haven't sold in a while, grouped into aging, slow, and dead stock — candidates for a promo or clear-out.
Shrinkage tracker	Flags gaps between what was received/sold and what's actually on hand — possible loss, miscounts, or unrecorded movement.
Cash in expiring stock	The peso value tied up in stock that's expiring soon, bucketed by urgency.

Inventory

Page	What it is for
Dashboard	Your at-a-glance overview — total stock, what's running out, what's expiring, and value by product line. A good place to start each day.
Action center	Your daily to-do in one place — what to order now, what to promo or move before it expires, what to review, and dead stock to clear. Pulls together the whole app so nobody has to hunt across tabs.
All SKUs	Every product in one searchable table. Filter by line or category and click any row for full detail.
Batch view	Every batch in FEFO order (first to expire, first out) — the sequence to pull stock in.
Item master	The item master — products, prices, costs, and barcodes owned in-app. While in shadow mode, Shopify still prices the app; use this page to fix drift (△ rows) and add costs, then declare pricing independence on the Cutover switches page.
Product registrations	CPR/FDA product registrations per SKU with expiry dates — expired and expiring-soon registrations float to the top so renewals never slip.

Alerts

Page	What it is for
Out of stock	Products that have hit zero stock — these need reordering now.
Low stock	Products with fewer than 10 units left — running thin.
Negative stock	Products showing negative stock, which usually points to a miscount or data slip worth checking.
Expiry tracker	Batches sorted by expiry date, soonest first. Use it to decide what to sell or use up before it expires.
Reorder alerts	Products that have dropped below their reorder point (or a threshold you set) and should be reordered.

Planning

Page	What it is for
Stockout forecast	Predicts when each product will run out, using recent sales trend and seasonality. Order the red ones first.
Stock coverage	How much runway you have — weeks or months of stock left at the current sales pace, per product. The chart groups SKUs from critically low to overstocked; the list ranks them lowest-cover first.
Reorder plan	Turns the forecast into a shopping list — how much to order of each item and the estimated cost. Adjust lead time and coverage up top, then export a draft PO.
Reorder point	The “buy-again” level for each product, based on how fast it sells and how erratic demand is. Stock at or below the reorder point means it’s time to order.
Demand variability	Sorts products into steady, variable, and lumpy by how consistent their sales are — so you know which forecasts to trust and which need a human eye.
ABC analysis	Ranks products by how much of your sales value they drive. A-items are the vital few to watch and count most closely.
Write-off forecast	Estimates how much stock will expire unsold at the current pace, and the peso value at risk. Tackle the biggest ones first.
Forecast accuracy	The honest test of the forecast: at the start of each month the model’s prediction per SKU is frozen; a month later it’s scored against what actually moved. MAPE = average % miss per SKU.
Campaign calendar	Planned promos and campaigns as a demand signal. Anything added here shows as a banner on the stockout forecast and feeds the AI planning review, so a “10+8 anniversary promo” stops being a forecast surprise.
Promotions	Promotions as configuration instead of free-typed deal lines: define a mechanic (buy-N-get-M free, or % off), a validity window, and the eligible SKUs — order entry applies it automatically while the promo is live.
AI planning review	Demand planning AI: walks every SKU (stock, velocity, days-to-stockout, expiry) plus the campaign calendar and recent forecast misses, then reports the exceptions — stockout risks, expiry money, and 5 prioritized actions. An analyst, not an oracle: sanity-check quantities before ordering.

Simulators

Page	What it is for
What-if simulator	Play out a scenario — change demand or delay the next shipment — and see the effect on stockouts, write-offs, and spend.
Promo rescue simulator	Tests whether discounting near-expiry stock pays off: set how much faster a promo sells and the discount offered, and see write-off avoided versus margin given up.
Budget optimizer	Given a set purchasing budget, it chooses what to order first to prevent the most stockouts — urgent and high-value items lead.
Service-level simulator	Shows the trade-off between service level and cash: a higher target means fewer stockouts but more money parked in safety stock.
Campaign surge simulator	Model a campaign that spikes demand for a product line, and see which items would run out and how much to pre-buy.
Monte Carlo stockout risk	Rather than a single guess, it simulates each product's demand hundreds of times to give a probability of stocking out — accounting for how unpredictable each one is.
12-month projection	A 12-month forecast for one product: projected demand, a declining stock line showing when it runs out, and a confidence band around it.
Cash-flow timeline	Projects inventory cash over six months — restocking spend versus sales coming in — so you can see when cash is most tied up.
Bulk-buy trade-off	Checks whether a volume discount is worth it: weighs the savings against extra holding cost and the risk of stock expiring before it sells.
Remedy branch rebalancing	Suggests moving stock between Remedy's branches (BGC, Vertis North, Greenhills) to balance each site's share and use up near-expiry stock. Remedy is a sister company and a customer; this is based on what Healthspan has shipped to them.

Analytics

Page	What it is for
Data health	A completeness check on the data behind every forecast — SKUs missing a price, expiry, batch, or bin, negative stock, and items with too little sales history. Fixing these in the source sheet sharpens the whole app.
Monthly movement	Units received versus sold each month over the past year — the pulse of what's coming in and going out.
Inventory value	Where your inventory money sits, broken down by product line.
Deal scenarios	What the current stock is worth if everything sells à la carte versus through the bundle deals (2+1 up to 6+1, where the +1 is free). Prices are live from Shopify where connected (sheet price otherwise).
